ABSTRACT

A compilation of basic information on pyrotechnically actuated devices and systems used in NASA aerospace and aeronautic applications was formed into a catalog. The intent is to provide (1) a quick reference digest of the types of operational pyro mechanisms and (2) a source of contacts for further details. Data on these items was furnished by the NASA Centers that developed or utilized such devices to perform specific functions on spacecraft, launch vehicles, aircraft and ground support equipment. Information entries include an item title, user center name, commercial contractor and vendor, part number identification, a representative figure, and a brief description of purpose, previous usage, and operational characteristics.

INTRODUCTION

In July 1991, the NASA/DOD/DOE Pyrotechnic Steering Committee, chaired by Norm Schulze of NASA Headquarters, delegated the NASA Lewis Research Center as the responsible agency for developing a hardware catalog to fit into an all-encompassing aerospace pyrotechnic information database under the NASA Pyrotechnically Actuated Systems Program Plan (Project No. 1.4). Completion of the catalog required the efforts and cooperation of several different NASA centers, various DOD and DOE organizations, and more recently, industry.

The purpose of the catalog is to provide an organized quick reference source for users or designers of critical aerospace pyrotechnic devices and systems. Among the fundamental objectives of the Steering Committee are to foster inter-agency cooperation and understanding of developments concerning pyrotechnic devices, to assure that duplication of efforts is prevented, and to facilitate coordination and communications among the aerospace pyrotechnic community. This catalog is a valuable tool to assist in fulfilling these objectives.

The subject matter and format of the catalog were defined by the Steering Committee members' inputs. LeRC initiated activity in 1991-92 and distributed questionnaires to the NASA/DOD/DOE centers in September 1992. In 1993, approximately 150 catalog items were entered into the catalog, each including a scanned image of a schematic. In 1994, the catalog was organized to reflect the review comments solicited from Steering Committee members. The first issue of the Catalog (NASA TM-106810) was distributed to the Steering Committee members in January 1995.

This issue, revision A, replaces the previous issue and marks the accomplishment of two milestones. First, in terms of hardware, it is a significant expansion of the first issue. Added to the catalog are devices from the Jet Propulsion Laboratory and many of the more prominent devices from the NASA Johnson Space Center. Second, the information added in this issue was largely provided by the vendors of the NASA devices. This approach was viewed as more efficient and of mutual benefit to government and industry. It also led to the consideration of adding a commercial supplement to the catalog in the future.

Like the previous issue, the second issue is intended as a reference document to provide the user or designer a quick means of identifying available pyrotechnic items. The catalog contains only those devices or systems that are presently or previously used, plus newly developed units, in the field of aerospace and aeronautic pyrotechnics. Data on each device and system includes the item title, agency/center, contractor and/or vendor name, and identification number. A figure is presented for most items. The purpose and the operational description of the item are briefly stated and previous usages are identified. General performance parameters and environmental characteristics are also specified. Each pyrotechnic system contains a listing of the devices or mechanisms which make up the assembly. Qualification documentation, additional references, other comments, and any special features are also included.

The devices and systems are arranged alphabetically and categorized by their functionality. The titles of each item are listed in a cross reference index by agency/center. When reviewing the catalog, the user or designer should refer to the procuring agency/center and the selling agency for additional data. For this reason, the contributing centers and their addresses are separately listed and contractor and/or vendor names are furnished within the respective items.

This catalog was put together with the intention of aiding designers and users in their design, application or use of pyrotechnic devices and systems. The authors hope that it proves to be a handy and beneficial source of information to the aerospace pyrotechnic community.

Lastly, the authors extend their thanks and appreciation to the NASA Centers and other government organizations, as well as industry, without whose contributions and participation this catalog could not have been made possible.

CENTER/AGENCY CONTRIBUTORS

Data on pyrotechnically actuated devices and systems, used by the contributing Center, were furnished by the respective center members of the Aerospace Pyrotechnic Steering Committee. The information includes figures and diagrams on the mechanisms and assemblies. All data relates to previously used, currently operational, or newly developed items.

The contributing centers are as follows:

NASA Goddard Space Flight Center
Greenbelt, Md 20771
301-286-2000

NASA Jet Propulsion Laboratory
Pasadena, CA 91109
818-354-4321

NASA Lyndon B. Johnson Space Center
Houston, Tx 77058
713-483-0123

NASA John F. Kennedy Space Center
Kennedy Space Center, FL 32899
407-867-7110

NASA Langley Research Center
Hampton, Va 23665-5225
804-864-1000

NASA Lewis Research Center
Cleveland, Oh 44135
216-433-4000

NASA George C. Marshall Space Flight Center
Marshall Space Flight Center, AL 35812
205-544-2121

CONTRACTOR CONTRIBUTORS

The contributing contractors are as follows:

Hi-Shear Technology Corporation
24225 Garnier Street
Torrance, CA 90505-5323
(310) 784-7854

Irvine Industries, Inc.
3333 West Warner Avenue
Santa Ana, CA 92704
(714) 662-1400

OEA Aerospace
P.O. Box KK
Fairfield, CA 94533
(707) 422-1880

Pacific Scientific
Energy Dynamics Division
7043 West Boston Street
Chandler, AZ 85226
(602) 961-0023

Roberts Research Lab
23150 Kashiwa Ct.
Torrance, CA 90505
(310) 320-7310

Scot Incorporated
2525 Curtis Street
Downers Grove, IL 60515
(708) 969-0620

UPCO
25401 North Central Avenue
Phoenix, AZ 85027-7837
(602) 869-8067

USBI
188 Sparkman Drive
Huntsville, AL 35807
(205) 721-2995

DISCLAIMER

Information in this catalog on pyrotechnic devices and systems was gathered from NASA Centers that have used or are currently employing these assemblies on spacecraft, launch vehicles, aircraft, ground support equipment, or are in test phase.

The intended application of the data is a ready reference of types of items available or recently used so that a designer can perform a basic review of those units that are of the nature desired. Actual usage of this information must be limited to a search of the field of devices and systems as a preliminary to a follow up contact with the associated center, contractor, vendor or all three to obtain design specifics, requirements, and for compliance with any legal restrictions.

Accordingly, as a reminder, each page of data has the following heading imprinted thereon:

This document is an information source only and should not be used for design purposes.

NASA/DOD/DOE Pyrotechnic Device

TITLE: Actuator - Bellows

AGENCY/CENTER: NASA Jet Propulsion Laboratory (JPL)

PHYSICAL DATA:

ACTUATOR - BELLOWS

CONTRACTOR: n/a.

SUBCONTRACTOR: Pacific Scientific.

DEVICE IDENTIFICATION NUMBER:

JPL 10086783-1, Pacific Scientific 50-7490-2.

PURPOSE:

The bellows actuator provides an initiating charge and self-contained mechanism used for low-shock thrusting applications.

PREVIOUS USAGE:

Voyager and Galileo; EPD and PLS Sunshade Latch Retractor (JPL 10126739).

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

Upon initiation, the pyrotechnic composition generates an internal gas pressure sufficient to unfold the integral bellows. The unfolding action develops a force of 30 pounds (min) over a stroke of .250 (min) in approximately 15 milliseconds.

ENERGY SOURCE:

TYPE OF INITIATION: Electrically initiated; 5 to 22 amps.

CHARGE MATERIALS:

Boron-Calcium-Chromate (prime charge), HNS-II (main charge).

ELECTRICAL CHARACTERISTICS:

Bridgewire resistance: 1.0 +/- 0.1 ohm. No-fire Current: 0.6 amps for 5 minutes, All-fire: 4.5 amps.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -115°C
High +80°C

PRESSURE: n/a

DYNAMICS:

SHOCK: n/a

VIBRATION: Sine (400 to 1000 HZ) 10.0 g's RMS, Random 49.5 g's RMS (3 min/axis)

QUALIFICATION:

DOCUMENTATION: JPL ES512655 & TS512656

SERVICE LIFE:

SHELF: 15 Years

OPERATIONAL: 15 Years

ADDITIONAL REFERENCES:

n/a

ADDITIONAL COMMENTS:

n/a

SPECIAL FEATURES:

n/a

NASA/DOD/DOE Pyrotechnic Device

TITLE: Bolt - External Tank Intertank GH2 Umbilical Separation

AGENCY/CENTER: NASA Marshall Space Flight Center (MSFC)

PHYSICAL DATA:

SEPARATION BOLT (ET GH₂ UMBILICAL)

CONTRACTOR: Martin-Marietta Corporation

SUBCONTRACTOR: Hi-Shear Corporation

DEVICE IDENTIFICATION NUMBER:

Martin PD 5000020-060

PURPOSE:

To retain the GH₂ umbilical to the intertank of the ET until the pressure cartridge causes the breakage of the separation bolt at liftoff.

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

Two redundant pressure cartridges discharge into the cartridge adapter and actuate the piston in the separator bolt assembly. The piston separates the bolt by axial tension at the separation plane.

ENERGY SOURCE:

TYPE OF INITIATION: Pressure Cartridge

CHARGE MATERIALS:

n/a

ELECTRICAL CHARACTERISTICS:

n/a

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low Ambient

High -200° F (after propellant loading)

PRESSURE: Tensile Proof Load: 5,450 (+50,-0) pounds

Ultimate Strength (bolt notch) axial tensile load: 8,000 (+/- 500) pounds

DYNAMICS:

SHOCK: n/a

VIBRATION: n/a

QUALIFICATION:

DOCUMENTATION: n/a

SERVICE LIFE:

SHELF: Temperature: -40° F to +160° F for 50 hours

Humidity: 0 to 100 percent

Storage Life: 10 years

OPERATIONAL: n/a

NASA/DOD/DOE Pyrotechnic Device

TITLE: Bolt - Ridge Cut Explosive

AGENCY/CENTER: NASA Langley Research Center (LaRC)

PHYSICAL DATA:

CONTRACTOR: Teledyne McCormick Selph

SUBCONTRACTOR: Same as Contractor above

DEVICE IDENTIFICATION NUMBER:

n/a

PURPOSE:

Instantaneous release of helicopter external stores.

PREVIOUS USAGE:

This bolt design has been applied to a number of aerospace applications.

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

The large diameter thread was installed and locked into the store. The store was then lifted and the bolts were inserted into the aircraft mounting plate.

The 450 milligram explosive main charge provides the energy to fracture the bolt. This bolt does not rely on explosively generated gas pressure to burst the housing, but depends on explosively generated augmented shock waves, which exceed the tensile strength of the material to cause separation. The external configuration of the bolt stem is designed to reflect incident shock waves to induce tensile failure in a conical plane emanating from the bottom of the explosive cavity to a point to the left of the deep circumferential notch. Thus, the name "ridge cut" bolt. Unlike the conventional bursting explosive bolt, little or no fragmentation is produced.

Initiation of the bolt's main charge was accomplished by transferring the explosive pressure wave generated by the tip of the flexible explosive transfer line through the silicone potting to drive the circular firing pin into the dual percussion primers. The transfer tip is then initiated to initiate bolt's main charge.

ADDITIONAL COMMENTS:

n/a

SPECIAL FEATURES:

The silicone potting prevented concern for contaminating the explosive material; water in the connector would actually enhance

NASA/DOD/DOE Pyrotechnic Device

transfer of the explosive shock wave to the firing pin. The input fitting to the bolt is a push/rotate electrical-type connector, which is unique in the aircraft arena.

Design and development emphasis was placed on proving functional margins for all aspects of use and interfaces. Previously qualified design principles and hardware were employed to reduce the number of tests to demonstrate reliability and to eliminate the need for environmental qualification.

NASA/DOD/DOE Pyrotechnic Device

TITLE: Bolt - Separation

AGENCY/CENTER: NASA Lewis Research Center (LeRC)

PHYSICAL DATA:

CONTRACTOR: General Dynamics Space Systems Division (GDSSD)

SUBCONTRACTOR: Hi Shear Technology Corporation

DEVICE IDENTIFICATION NUMBER:

Contractor Spec. 55-07057

PURPOSE:

To attach separable structural items into an assembly. At event time the separation bolts can be fractured at a definite groove by pyro forces to allow separation of the structures.

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

Expendable Launch Vehicles: Atlas Centaur Vehicles AC-26 thru AC-68

OPERATIONAL DESCRIPTION:

Gas pressure from an activated pressure cartridge produces a force on the primary piston which applies the force on the small end of the force amplifier. The silicone rubber amplifier acts, for short duration loads, as an incompressible fluid and multiplies the force based on the area ratio of small to large ends. This amplified force is applied to the secondary piston which butts against the piston assembly of the opposite end. Reaction forces into the body fracture the bolt at the center groove and cause separation.

ENERGY SOURCE:

SRB/ET AFT STRUT SEPARATION BOLT

CONTRACTOR: USBI

SUBCONTRACTOR: Hi-Shear Corporation

DEVICE IDENTIFICATION NUMBER:

USBI PN 10302-0001-801

PURPOSE:

To provide separation at the solid rocket booster/external tank (SRB/ET) aft strut separation plane.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

The bolts are fractured at the preselected fracture groove when the NASA standard initiator (NSI) pressure cartridges are initiated. The pressure produced by each NSI pressure cartridge acts against a primary piston. The force of the primary piston is amplified through the compression of soft lead couplings. The amplified force is then applied to a secondary piston. The redundant side of the bolt also applies a amplified force to its secondary piston. The two secondary pistons reacting against each other or against the shoulder of the opposite insert, depending on the simultaneity of the firing of the two cartridges, cause the bolt housing to fail in tension. The sudden release of tension and the extra margin of force/piston overstroke will accelerate both ends of the bolt to approximately 100 foot/second.

10319-0002-802 (ALT)

PURPOSE:

To actuate the parachute release nut.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

The CDF pressure cartridge is used to actuate the parachute release nut and is initiated by a detonation shock from a CDF assembly. The detonation shock initiates the donor charge and propagates through the bulkhead to the receptor charge, which initiates the output charge. The donor and receptor charges are packed intimately against both sides of the bulkhead in a manner that ensures shock wave propagation through the bulkhead without rupturing or cracking the bulkhead. The output is reduced to a deflagration which is used to initiate a gas producing output mix or propellant.

ENERGY SOURCE:

TYPE OF INITIATION: CDF Assembly

CHARGE MATERIALS:

Donor Charge: 46 to 50 mg, Class 2, PETN per MIL-P-387

Receptor Charge: 32 to 36 mg, Class 2, PETN per MIL-P-387

Output Charge: 169 to 171 mg, Hercules Hi-Temp

ELECTRICAL CHARACTERISTICS:

n/a

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F for 12 hours

High +190° F for minimum of 4 hours.

PHYSICAL DATA:

THRUSTER PRESSURE CARTRIDGE

CONTRACTOR: USBI

SUBCONTRACTOR: Hi-Shear Corporation

DEVICE IDENTIFICATION NUMBER:

USBI PN 10305-0001-801

PURPOSE:

To provide the proper pressure during the time in which the thruster is operating.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

The pressure cartridge is initiated when the output of a Confined Detonating Fuse (CDF) assembly causes the firing pin to strike the percussion primer. The percussion primer ignites the ignition mix which travels down the seven holes and ignites the main grain and pressure mix. The pressure mix is needed to rapidly pressurize the initial volume of the thruster. As the seven holes in the main grain burn, the surface area and gases produced increase, which is required to maintain almost constant force on the thruster. The combined force of the three thrusters accelerate the Solid Rocket Booster (SRB) nose cap to a required minimum velocity of 80 feet per second.

ENERGY SOURCE:

TYPE OF INITIATION: CDF Assembly

CHARGE MATERIALS:

Propellant Grain: Thiokol TP-H-3282C (55 gms). Pressurizer Mix: Hercules Hi-Temp (3 +/- 0.05 gms). Ignition Mix: Boron Potassium Nitrate (BKNO3) granules (1.2 +/- 0.05 gms) per MIL-P-46994, Type I-B. Primer: Olin Mathieson M42C1-PA101 per MIL-P-20444 (0.31 to 0.36 grain).

ELECTRICAL CHARACTERISTICS:

n/a

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F

High +195° F for 4 hours

PRESSURE: Output: The pressure cartridge will develop pressure within 3 ms after being initiated by a CDF assembly. The max. press. after initiation is 14,673 psi in a 24 cubic inch closed bomb at +195° F after approx. 25 ms.

PHYSICAL DATA:

PYROTECHNIC VALVE ACTUATION CARTRIDGE

CONTRACTOR: Martin-Marietta Corporation

SUBCONTRACTOR: Hi-Shear Corporation

DEVICE IDENTIFICATION NUMBER:

Martin PD 5000011-009

PURPOSE:

To produce a gas output to actuate the pyrotechnic-operated tumble valve.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

The pyrotechnic valve actuation cartridge will receive a detonation impulse from a NSD and will provide a detonation transfer through a bulkhead. Explosive material packed intimately against both sides of the bulkhead will ensure detonation propagation through the bulkhead. The detonation transfer across the bulkhead will not rupture the bulkhead. The output of the receptor charge ignites the output charge, which reduces to a deflagration in the output mix. The output mix produces the gas pressure to operate the tumble valve.

ENERGY SOURCE:

TYPE OF INITIATION: NSI

CHARGE MATERIALS:

Donor Charge: 73-77 mg of RDX, Type A, Class C, per MIL-R-398,
Receptor Charge: 38-42 mg of RDX, Type A, Class C, per MIL-R-398,
Output Charge: Pellet: 1015 to 1025 mg of ZrKClO₄, Loose mix:
100 mg of ZrKClO₄

ELECTRICAL CHARACTERISTICS:

AGENCY/CENTER: NASA Jet Propulsion Laboratory (JPL)

PHYSICAL DATA:

CORD - DETONATING

CONTRACTOR: n/a

SUBCONTRACTOR: n/a

DEVICE IDENTIFICATION NUMBER:

JPL 10152986

PURPOSE:

The detonating cord assembly is used to transfer detonation stimulus around the circumference of linear separation systems.

PREVIOUS USAGE:

Voyager, Galileo, and Cassini.

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

The assembly consists of a lead-clad mild detonating cord which is placed into a silicone rubber charge holder. Upon initiation from a donor explosive, the cord detonates, along the entire length, causing a traveling shock wave. The shock wave is used to deform and fail structural elements associated with linear separation systems.

Flight Facility (WFF)

PHYSICAL DATA:

FLEXIBLE CONFINED DETONATING CORD (FCDC)

CONTRACTOR: EER Systems Corporation

SUBCONTRACTOR: Ensign Bickford Aerospace

DEVICE IDENTIFICATION NUMBER:

FCDCA

PURPOSE:

Couple the explosive output of the system initiator (either Lanyard Delay Detonator or detonator in command portion of Flight Termination System) to the vehicle destruct charge.

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

ORBUS Flight Termination System, Red Tigress, Leap, Atlas/Centaur, Conestoga/COMET

OPERATIONAL DESCRIPTION:

The FCDC lines are attached to the appropriate system initiator block where a controlled gap between the detonator and FCDC end tip is maintained. The FCDC lines are routed through multiple manifolds and other devices to the system destruct charge. When a destruct detonator is fired, the FCDC lines are initiated which in turn initiates the appropriate destruct charge.

PARACHUTE REEFING LINE CUTTER(S)

CONTRACTOR: USBI

SUBCONTRACTOR: UPCO

DEVICE IDENTIFICATION NUMBER:

- 18 Parachute cutters:
- 2 Cut Loop Drogue, 0 sec. delay, 10320-0001-801
- 2 First Stage Drogue, 7 sec. delay, 10320-0001-802
- 2 Second Stage Drogue, 12 sec. delay, 10320-0001-804
- 6 First Stage Drogue, 10 sec. delay, 10320-0001-803
- 6 Second Stage Drogue, 17 sec. delay, 10320-0001-805

NASA/DOD/DOE Pyrotechnic Device

PURPOSE:

To provide a time delay from a mechanical initiation and then to sever reefing lines for parachute deployment.

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

The firing mechanism assembly is activated by the shear assembly being pulled and compressing the spring with the firing pin. The shear assembly releases and the firing pin strikes the primer. The primer initiates the transfer charge and starts the tungsten time delay. At the end of the delay time, the initiation charge is initiated which initiates the main charge. The main charge drives the blade into the anvil and cuts the reefing lines.

ENERGY SOURCE:

TYPE OF INITIATION: Mechanical, spring-loaded pin

CHARGE MATERIALS:

Initiation Charge: SOS-285 (150 mg), Transfer Charge: A-A1, Tungsten Delay: SOS-290 or SOS-289, Main Charge: Hercules Hi-Temp (100 mg), Primer: M42C1 per MIL-P-20444

ELECTRICAL CHARACTERISTICS:

n/a

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F

High +200° F for 4 hours

NASA/DOD/DOE Pyrotechnic Device

TITLE: Cutter - RSRA Pendant

AGENCY/CENTER: NASA Langley Research Center (LaRC)

PHYSICAL DATA:

PENDANT CUTTER

CONTRACTOR: Sikorsky Aircraft

SUBCONTRACTOR: Stanely Aviation

DEVICE IDENTIFICATION NUMBER:

n/a

PURPOSE:

Sever the pendant line connecting the crewmember and rocket, 0.8 second after pendant line stretch in the rocket launch.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

The pendant line is attached to the firing bolt at the right; the pendant line to the seat assembly's upper corners routs the cutter's aperture. At pendant line stretch, the firing bolt (containing the primer-initiated cartridge) shears the initiating shear pin and forces the percussion primer to the right against the fixed firing pin. The cartridge's output drives the blade to the left, shearing its shear pin and cutting the pendant line.

ENERGY SOURCE:

TYPE OF INITIATION: Mechanical firing pin

CHARGE MATERIALS:

n/a

ELECTRICAL CHARACTERISTICS:

n/a

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -65°F
High +200°F

PRESSURE: n/a

DYNAMICS:

SHOCK: helicopter environment

VIBRATION: helicopter environment

QUALIFICATION:

DOCUMENTATION: Bement, Laurence J.: "Helicopter (RSRA) In-Flight Escape System Component Qualification" Presented at the Tenth Symposium on Explosives and Pyrotechnics, San Francisco, CA, February 14-16, 1979.

SERVICE LIFE:

SHELF: 7 years

OPERATIONAL: 5 years

ADDITIONAL REFERENCES:

n/a

ADDITIONAL COMMENTS:

The approach for qualification of this system was to minimize the quantity of device and system-level testing through an emphasis on functional margin demonstrations during development. The snatch loads on the pendant line were so severe that the blade's shear pin failed. Bench tests, simulating actual deployment, revealed that this shear pin strength had to be increased from 140 to 2200 pounds force.

AGENCY/CENTER: NASA Langley Research Center (LaRC)

PHYSICAL DATA:

CANOPY REMOVAL PATTERN - POSITION

CONTRACTOR: Sikorsky Aircraft

SUBCONTRACTOR: Teledyne McCormick Selph

DEVICE IDENTIFICATION NUMBER:

n/a

PURPOSE:

Explosively severs and fractures the 0.25-inch thick, cast acrylic RSRA overhead canopies.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

The RSRA's single and double-curvature canopies were explosively severed and fractured into pieces no larger than 0.5 square foot by two simultaneously initiated loops of lead-sheathed 3 grains/foot explosive (hexanitrostilbene (HNS)) cord. The four ends of the cord had booster tips installed and were cast into a common manifold, which was initiated by a dual input. The explosive cord was housed in a 0.25-inch diameter silicone rubber extrusion, which was bonded directly to the interior surface of the canopy. Severance occurs immediately above the explosive cord, followed by secondary fracturing in parallel planes on each side of the cord. Furthermore, secondary cracks occurred between loops of the inside pattern, from those loops to the peripheral cord and down the centerline of the internal pattern.

NASA/DOD/DOE Pyrotechnic Device

TITLE: Detonator - Electro-Explosive

AGENCY/CENTER: NASA Lewis Research Center (LeRC)

PHYSICAL DATA:

ELECTRO-EXPLOSIVE DETONATOR (EED)

CONTRACTOR: General Dynamics Space Systems Division (GDSSD)

SUBCONTRACTOR: Hi Shear Technology Corporation

DEVICE IDENTIFICATION NUMBER:

Contractor Spec. 55-07041

PURPOSE:

To provide detonating energy by converting electrical energy into thermal energy at the detonator bridgewire and sequentially, via the heat sensitive pyrotechnic charge in contact with the bridgewire, into detonator pyrotechnic energy for initiating the firing of a main pyrotechnic charge.

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

Expendable Launch Vehicles:
Atlas Centaur Vehicles through AC-68
Titan III Centaur Vehicles through TC-7

OPERATIONAL DESCRIPTION:

At event time, power is supplied to the EED. The electrical energy heats the bridgewire which activates the heat sensitive initiator charge in the detonator. Further heat and pressure from this ignition detonates the main charge. Released energy from the detonation blasts and erodes the thin end shell of the EED and starts detonation of the next item in the pyrotechnic charge train.

ENERGY SOURCE:

TYPE OF INITIATION: electrical bridgewire

CHARGE MATERIALS:

RDX

PHYSICAL DATA:

NON-ELECTRIC DETONATOR (NED)

CONTRACTOR: General Dynamics Space Systems Division (GDSSD)

SUBCONTRACTOR: Hi Shear Technology Corporation

DEVICE IDENTIFICATION NUMBER:

Contractor Spec. 55-07040

PURPOSE:

To increase the pyrotechnic energy at the ends of linear charge cord (Mild Detonating Fuse, Confined MDF, Flexible Linear Shaped Charge) by functioning as a booster charge for propagating firing from a pyrotechnic item to the cord or from the cord to another pyrotechnic item in a multiple explosive charge system.

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

Expendable Launch Vehicles:
Atlas Centaur Vehicles through AC-68
Titan III Centaur Vehicles through TC-7

OPERATIONAL DESCRIPTION:

As a receiver booster, the non electric detonator is activated by the blast energy received from an electric detonator or from the preceding pyro firing in the system charge train. In sequence, the NED blast activates the attached linear charge (mild detonating fuse or shaped charge). As a doner booster, the NED is activated by firing energy donated from the attached linear charge and in-turn activates the follow-on pyro item in the system.

ROTOR SYSTEMS RESEARCH AIRCRAFT ESCAPE SEAT

CONTRACTOR: Stanley Aviation

SUBCONTRACTOR: n/a

DEVICE IDENTIFICATION NUMBER:

n/a

PURPOSE:

Sequentially extract three crewmembers from the (RSRA)

PREVIOUS USAGE:

Several propeller-driven, fixed wing aircraft, including the T-28.

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

On pulling the initiation ring at the front of the seat, a powered inertia reel withdraws the crewmember to the seat back. The extraction rocket was catapulted from the aircraft, using common-manifold, dual piston/cylinder mortars. On full extension of the pendant line, the 28-pound, hammerhead rocket ignites, producing 2000 pounds of thrust for a half-second. With pendant line stretch, the g level on the crewmember is approximately 16. As the seat progresses up the guide rails a rail protrusion trip releases the diagonal struts to allow the seat pan to drop and position the crewmember into a near standup position. The seat pan drop also triggers a pyrotechnic time-delayed, barostat-activated parachute release. The seat back (parachute assembly) stays with the crewmember throughout extraction, and is released by pyrotechnic time delayed thrusters at the seat back corners to release the inertia reel straps and at the seat buckle. The rocket motor is released by a pyrotechnic time-delayed pendant cutter to avoid contacting the crewmember. The parachute, deployed by a static line attached to the aircraft is packaged under the seat pan. The parachute risers are routed over the seat back and to the crewmember's shoulders. A major advantage of this system over ejection seats is the low profile of the standing crewmember.

PURPOSE:
Initiate a standard explosive transfer line.

PREVIOUS USAGE:
n/a

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

The plunger was thrust inward by the ramp interface on the RSRA thruster. This motion compressed a firing spring, until the ball detent was released to allow the firing pin to be driven into a percussion primer, which in turn initiated a transfer tip. This tip then initiated an explosive transfer line.

ENERGY SOURCE:

TYPE OF INITIATION: Explosive transfer line

CONFINED DETONATING FUSE (CDF) ASSEMBLY

CONTRACTOR: USBI

SUBCONTRACTOR: Ensign Bickford and Teledyne McCormick-Selph

DEVICE IDENTIFICATION NUMBER:

USBI PN

Ensign Bickford 10314-0001-8XX; Teledyne 10315-0001-8XX

PURPOSE:

To provide a means of detonation propagation between ordnance devices.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

The CDF assembly consists of a mild detonating fuse, layers of material as the confining agent, identical end connectors and sleeves, and booster charges to ensure detonation transfer to the mating device. Each sleeve incorporates index keys to prevent connection of unrelated pyrotechnic systems, and reference designators are required on all solid rocket booster/CDF (SRB/CDF) assemblies as an aid for proper installation.

ENERGY SOURCE:

TYPE OF INITIATION: CDF Manifold or NASA standard detonator (NSD)

CHARGE MATERIALS:

Base Charge: Superfine PETN (53 mg) per MIL-P-387

Carrier Charge: Superfine PETN (20 mg) per MIL-P-387

Mild Detonator Fuse (MDF): Silver Sheath with 2.5 gpf HNS, Type II, Grade A per WS5003

AGENCY/CENTER: NASA Lewis Research Center (LeRC)

PHYSICAL DATA:

MILD DETONATING FUZE (MDF)

CONTRACTOR: General Dynamics Space Systems Division (GDSSD)

SUBCONTRACTOR: Ensign Bickford Co.

DEVICE IDENTIFICATION NUMBER:

Contractor Spec. 55-00212

PURPOSE:

To transfer energy from an initiator or from an actively firing device by confined firing along the fuse length to detonate a follow-on pyrotechnic item.

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

Expendable Launch Vehicles:
Atlas Centaur Vehicles through AC-68
Titan III Centaur Vehicles through TC-7

OPERATIONAL DESCRIPTION:

The mild detonating fuse is used to transfer pyrotechnic firing from one pyrotechnic item to another and thereby continue a pyrotechnic propagation. Often, a non electric detonator (booster charge) is connected at each end of the fuse to enhance the energy and assure good transfer.

ENERGY SOURCE:

TYPE OF INITIATION: Requires an initiator and booster.

PHYSICAL DATA:

CONFINED DETONATING FUSE (CDF) INITIATOR

CONTRACTOR: USBI

SUBCONTRACTOR: UPCO

DEVICE IDENTIFICATION NUMBER:

USBI PN 10308-0003-801

PURPOSE:

The CDF initiator is a device designed to initiate the igniter of a solid propellant motor and is used to initiate the booster separation motor (BSM) on the solid rocket booster (SRB).

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

The donor charge of the CDF initiator is initiated by a CDF assembly. The donor charge propagates a shock through the bulkhead to the receptor charge which initiates the output charge. The donor and receptor charges are packed intimately against both sides of the bulkhead. The arrangement ensures shockwave propagation through the bulkhead without rupturing it, which provides an effective seal from the output charge and gases from the solid rocket motor.

ENERGY SOURCE:

TYPE OF INITIATION: CDF Assembly

NASA STANDARD INITIATOR

CONTRACTOR: n/a

SUBCONTRACTOR: Hi Shear Tech Corp., Universal Propulsion Co.,
Pacific Scientific.

DEVICE IDENTIFICATION NUMBER:

NASA JSC SEB26100001-XXX

PURPOSE:

The device is an electroexplosive used to "initiate" or ignite higher level assemblies.

PREVIOUS USAGE:

Standard EED in the Apollo, Skylab, Apollo-Soyuz and Space Shuttle programs. Standard for Aerospace community in payloads and launch

NASA/DOD/DOE Pyrotechnic Device

vehicles.

OPERATIONAL DESCRIPTION:

The NSI is an electro-explosive initiator with a single, one ohm, stainless steel, propellant-slurried bridgewire and a propellant charge of 114 mg of a Zirconium, Potassium Perchlorate, Viton B and Graphite blend.

ENERGY SOURCE:

TYPE OF INITIATION: Propellant-slurried bridgewire.

CHARGE MATERIALS:

See operational description above.

ELECTRICAL CHARACTERISTICS:

1 ohm bridgewire, 3.5 amp all-fire, 1 amp/1 watt no-fire.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -420°F

High +300°F

PRESSURE: 650 ± 125 psi in 10cc bomb.

DYNAMICS:

SHOCK: 100g, 11msec sawtooth.

VIBRATION: 28 g-rms random (-260°F to +300°F).

QUALIFICATION:

DOCUMENTATION: Hishear TR2-323; Space Ordnance System TR 6068.

NSI/SOLID ROCKET MOTOR IGNITER INITIATOR

CONTRACTOR: Thiokoi

SUBCONTRACTOR: Hi-Shear Corporation and UPCO

DEVICE IDENTIFICATION NUMBER:

NSI: JSC/SEB26100001-XXX.

SII: JSC/SED26100107-301.

PURPOSE:

To be the standard electroexplosive device for the Space Shuttle. NSIs are used to initiate pyrotechnic trains in Safe and Arm S&A devices, Confined Detonating Fuse (CDF) manifolds, CDF assemblies, booster cartridges, pressure cartridges, and NSDs.

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

Apollo, Skylab, Apollo-Soyuz

OPERATIONAL DESCRIPTION:

The NSI is initiated by the pyrotechnic initiator controller (PIC). The PIC capacitors are discharged into the NSI bridgewires, initiating the initiation charge. The initiation charge ignites the next stage of the pyrotechnic train.

DEVICE IDENTIFICATION NUMBER:

USBI PN ET: 10312-0002-803

SRB: 10312-0001-101 thru 10312-0001-108

PURPOSE:

To allow a NSD to initiate two to eight CDF assemblies.

PREVIOUS USAGE:

Saturn and Delta vehicles

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

The CDF manifold assembly is comprised of the explosive train or booster subassembly and the housing subassembly. The explosive train is comprised of a mild detonating cord (MDC), RDX (20 gpf), with thin-wall (5 mil) guiding metal cups on the ends. The housing subassembly consists of rectangular aluminum mounting blocks secured to a drilled and ported cylindrical aluminum housing. A NASA standard initiator (NSI) initiates the explosive train in the CDF manifold. The CDF manifold initiates the booster charges in the CDF assembly which initiates the CDF assemblies.

ENERGY SOURCE:

TYPE OF INITIATION: NSD

NASA/DOD/DOE Pyrotechnic Device

TITLE: Manifold - Transfer Line Multiport

AGENCY/CENTER: NASA Langley Research Center (LaRC)

PHYSICAL DATA:

CROSS SECTION OF MANIFOLD

CONTRACTOR: Teledyne McCormick Selph

SUBCONTRACTOR: See Contractor above.

DEVICE IDENTIFICATION NUMBER:

n/a

PURPOSE:

Transfer an explosive initiation signal from a standard explosive input to two quick-release flexible transfer lines attached to one side of the manifold.

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

This is generally accepted technology with a number of aerospace applications.

OPERATIONAL DESCRIPTION:

The input initiates the transfer charge, which is a thin-walled, steel tube filled with explosive. This explosive, on detonating, initiates its own tip charges, which in turn initiate the two tip charges in the male quick disconnect fitting. The two output ports were placed on the same side of the manifold for ease of access by the crew. In addition, these two fittings are oriented downward at a 45° angle, when mounted in the aircraft, to prevent contaminants, such as water, from entering the connector.

SUBCONTRACTOR: n/a

DEVICE IDENTIFICATION NUMBER:

n/a

PURPOSE:

Release telescope mounting gimbals following release from the Shuttle in orbit. The HALOE is an experiment on the Upper Atmospheric Research Satellite (UARS).

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

This pin puller, made from 6061-T651 aluminum, was qualified for the Viking Program. This pin puller released a high-gain antenna on the surface of Mars. A failed attempt was made by the Magellan Program (radar mapping of Venus) to use this pin puller to release solar panels.

OPERATIONAL DESCRIPTION:

The pin/piston was driven from left to right, failing the 80-pound static strength shear pin, with the output of a NASA Standard Initiator (NSI). The singly fired NSI outputs were directed into blind ports, which had a 0.1-inch diameter vent to the back side of the piston. The A 0.25-inch tall energy-absorbing steel cup removed the excess energy from the pin/piston at the end of the stroke.

"Determination of Pyrotechnic Functional Margin"
Presented at the 21st Annual SAFE Symposium,
November 11-13, 1991 in Las Vegas, Nevada.

SERVICE LIFE:

SHELF: 20 years

OPERATIONAL: 15 years

ADDITIONAL REFERENCES:

n/a

ADDITIONAL COMMENTS:

Following the failure of this pin puller design, manufactured by SOS for the Magellan Program, a failure investigation was initiated at NASA LaRC. It was found: 1) residual Viking units exhibited a marginal performance; the pin/piston had not stroked to the limit of its stroke; 2) the Viking Standard Initiator (VSI, virtually identical to the NSI) and two lots of NSI cartridges produced markedly different performances; 3) considerable blowby was occurring past all o-ring seals; o-ring seals were prevented from sealing by the chemical chromate coating wiping off from the piston bore onto the o-rings, and the molybdenum disulfide coating on the pin wiping off and piling up in front of the o-ring; and 4) friction, particularly with poor lubrication, consumed a great deal of energy in stroking. The pin puller was redesigned, using

NASA/DOD/DOE Pyrotechnic Device

a steel body and a nickel/Teflon dry-lubricant coating on the pin. Functional margins were demonstrated on this pin puller by comparing the energy required to stroke and lock to the energy deliverable by the NSI. "Energy required" was determined by dropping a small mass on the vertically oriented pin; the drop height was increased until the pin reached its full stroke. The drop tests were continued at increasing drop heights to calibrate the crush characteristics of the energy absorbing cup. "Energy deliverable" was determined by disassembling the pin pullers after each firing, measuring the cup crush, and relating to the previous calibration. The "energy deliverable" by the NSI lot selected for flight was more than 6 times the "energy required" to accomplish the function with the pin puller assembled into the gimbal interface.

AGENCY/CENTER: NASA Langley Research Center (LaRC)

PHYSICAL DATA:

PIN PULLER FOR CYCLIC STICK AND CONTROL ROD RELEASE

CONTRACTOR: Sikorsky Aircraft

SUBCONTRACTOR: Teledyne McCormick Selph

DEVICE IDENTIFICATION NUMBER:

n/a

PURPOSE:

Withdrawal of the pin released the cyclic sticks to prevent harm to crewmembers during extraction.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

An explosive transfer line input deflects a metal sealing diaphragm to drive the diring pin into the percussion primer to initiate the propellant. The piston is driven to the left, impacting (in stopping) against the housing, absorbing the excess energy in the crushing of the aluminum honeycomb. The full-rotating nut facilitated installation of the pin puller at any angle on the axis of the pin.

ENERGY SOURCE:

TYPE OF INITIATION: Explosive transfer line

NASA/DOD/DOE Pyrotechnic Device

TITLE: Pin Puller - Vent Door Latch

AGENCY/CENTER: NASA Lewis Research Center (LeRC)

PHYSICAL DATA:

CONTRACTOR: General Dynamics Space Systems Division (GDSSD)

SUBCONTRACTOR: Conax Corporation

DEVICE IDENTIFICATION NUMBER:

Contractor Spec. 55-71320

PURPOSE:

To extract a pin that holds a spring loaded vent door shut and thus allow door to open and venting to occur.

PREVIOUS USAGE:

Expendable Launch Vehicles:
Atlas Centaur Vehicles through AC-68

NASA/DOD/DOE Pyrotechnic Device

Titan Centaur Vehicles through AC-7

OPERATIONAL DESCRIPTION:

The pin puller is actuated just before vehicle liftoff by electrical power to the explosive cartridges (2 used redundantly - 1 is sufficient). Bridgewire heating activates charge in cartridge with resulting gas pressure moving piston and extracting latch pin.

ENERGY SOURCE:

TYPE OF INITIATION: Explosive cartridge with electric bridgeware.

CHARGE MATERIALS:

Proprietary mix

ELECTRICAL CHARACTERISTICS:

Normal 28 VDC, 5 amps (1 amp - 1 watt no fire)

RANGE SAFETY ORDNANCE SAFE AND ARM DEVICE

CONTRACTOR: USBI

SUBCONTRACTOR: Teledyne McCormick-Selph

DEVICE IDENTIFICATION NUMBER:

USBI PN 10311-0001-801

PURPOSE:

The range safety S&A device is a remotely controlled electro-mechanical ordnance device that is used to "safe" and to "arm" the Solid Rocket Booster (SRB) and External Tank (ET) destruct systems. The device can complete or interrupt the explosive train by remote control, provide position indications to remote

NASA/DOD/DOE Pyrotechnic Device

monitoring equipment, provide a visual position indication, and provide a manual operation capability.

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

The S&A device consists of a Ledex 95 degrees rotary solenoid assembly, a metal rotor shaft with two PETN explosive inserts, and position sensing and command switches that operate from the rotor shaft cam. On electrical command from the ground system just prior to automated countdown, the solenoid assembly rotates the shaft, containing the two explosive inserts, 90°. This aligns the inserts between the NSDs and the CDF assemblies to complete the explosive train.

ENERGY SOURCE:

TYPE OF INITIATION: NSD

CHARGE MATERIALS:

Mild Detonating Cord: Explosive Core: PETN Class 2 per MIL-P-387

Sheath: 0.999 pure aluminum

Explosive: 124 mg PETN Class 2 per MIL-P-387

DEVICE IDENTIFICATION NUMBER:

Contractor: 1U52295-01

PURPOSE:

To ignite the SRM igniter

PREVIOUS USAGE:

Minuteman

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

The SRM ignition S&A device is a two part electromechanical assembly. The actuation and monitoring (A&M) assembly is a reusable component and contains the electric drive motor, switches, manual safing mechanism, lock pin, and visual indicator, all in a sealed enclosure. The booster-barrier (B-B) assembly contains the safety barrier, the electrical initiator ports, the booster charge, the S&A-to-igniter adapter attachment flange, the remote safe and arm indicator switches, and the pressure seal surface to maintain pyrogen and motor chamber pressure.

ENERGY SOURCE:

TYPE OF INITIATION: NSI

CHARGE MATERIALS:

Boron Potassium Nitrate (BKNO₃) granules (1.4 grams) retained in a taped, perforated tube assembly. BKNO₃ pellets (18 grams) installed in the output end of the booster housing assembly.

ELECTRICAL CHARACTERISTICS:

n/a

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F
High +120° F

PRESSURE: The B-B assembly redundant seals will withstand a minimum pressure of 3,640 psig.

TITLE: Severance Assembly - RSRA Blade

AGENCY/CENTER: NASA Langley Research Center (LaRC)

PHYSICAL DATA:

CONTRACTOR: Sikorsky Aircraft

SUBCONTRACTOR: Teledyne McCormick Selph

DEVICE IDENTIFICATION NUMBER:

n/a

PURPOSE:

Explosively sever the RSRA rotor blades

PREVIOUS USAGE:

None

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

The tough (6061-T3 aluminum) rotor spar was severed by a carefully shaped flexible linear shaped charge (FLSC). The FLSC, 125 grains/foot, lead-sheathed CH-6 (94% cyclotrimethylene trinitramine (RDX), 6% wax) was manufactured in two lengths to allow assembly and mounted in rubber molding within a fiberglass housing. This assembly was bonded to the rotor spar. The assembly was sealed and closed-cell foam was employed in the shaped charge cavity to prevent contamination and assure that the FLSC's severability was maintained. The FLSC was initiated directly by a standard explosive transfer line tip. To assure initiation reliability, the lead sheath was machined to a minimum thickness at the input point.

ADDITIONAL COMMENTS:

Output: The detonation output of the LSC assembly shall be capable of severing a 0.125 inch, 2024-T8511 aluminum barrier plate (per QQ-A-250/30) and a 0.255 inch, 2219-T87 aluminum target plate per QQ-A-250/30. The barrier plate has insulation (15-19 lbs/ft³, 0.69 inch thick) directly under it, and the target plate has insulation (15-17 lbs/ft³, 0.23 inch thick) directly on top of it, with foam insulation (2.1-2.6 lbs/ft³, 1.00 inch thick) on top of the insulation. The standoff of the base of the LSC assembly from the barrier plate shall be 0.260 inch and from the target plate shall be 4.50 inch. The LSC assembly detonation shall cause complete severance of the target plate along a line corresponding to the entire length of each LSC segment of the assembly except for the areas covered by end fittings.

TITLE: Shaped Charge - Flexible Linear

AGENCY/CENTER: NASA Lewis Research Center (LeRC)

PHYSICAL DATA:

FLEXIBLE LINEAR SHAPED CHARGE (FLSC)
15 GR/FT SIZE SHOWN

--

CONTRACTOR: General Dynamics Space Systems Division (GDSSD)

SUBCONTRACTOR: Ensign Bickford Company (EBC)

DEVICE IDENTIFICATION NUMBER:

Contractor Spec. 55-00211

PURPOSE:

To separate one structure from another by use of pyrotechnic energy linearly severing the part by the blast cutting action of the high temperature explosive jet focused by the chevron shape of the charge.

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

Atlas Centaur Launch Vehicles through AC-68

OPERATIONAL DESCRIPTION:

The flexible linear shaped charge (FLSC) is chevron or inverted "V" shaped in section. Although activation causes outward force over 360 degrees, the chevron shape concentrates a portion of the blast energy below the open end of the inverted "V". Over a length of FLSC, the focused energy becomes a linear high temperature jet for cutting action by melting/blasting through a structural attachment.

Activation of the FLSC is accomplished by use of an initiator(s) in conjunction with booster detonators and confined mild detonating fuse firing transfer lines as appropriate.

ENERGY SOURCE:

TYPE OF INITIATION: Requires an initiator and booster charges

TITLE: Thruster - SRB Nose Cap

AGENCY/CENTER: NASA Marshall Space Flight Center (MSFC)

PHYSICAL DATA:

SOLID ROCKET BOOSTER NOSE CAP THRUSTER

CONTRACTOR: USBI

SUBCONTRACTOR: Hi-Shear Corporation

DEVICE IDENTIFICATION NUMBER:

USBI PN 10304-0001-801

PURPOSE:

To hold down the nose cap on the Solid Rocket Booster (SRB) until the nose cap separation command is initiated, and then to release and accelerate the nose cap to 80 feet per second.

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

Three thrusters, located 120 degrees apart on the top ring of the frustum, hold the nose cap on the SRB until the separation command is given at approximately 16,000 feet descent. At separation, the thruster pressure cartridge provides the pressure to shear the thruster shear flange and release the nose cap. The nose cap is accelerated to a minimum velocity of 80 feet per second due to the pressure acting on the piston over its six-inch stroke. At the end of the stroke, the piston and rod separate, allowing the piston to remain in the thruster body and seal in all the products of combustion. The rod stays with the nose cap to prevent drogue line interference.

ENERGY SOURCE:

TYPE OF INITIATION: Thruster Pressure Cartridge

CHARGE MATERIALS:

n/a

ELECTRICAL CHARACTERISTICS:

n/a

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F

High +195° F for 4 hours

PRESSURE: Thrust: When powered by a thruster pressure cartridge, the thruster releases and produces a 30,000 +/- 6,000 pound thrust over a six- inch stroke length while under a 0 to 2,000 pound side load on the piston rod.
Strength: The thruster will withstand a static tension load of 10,000 pounds applied through the one-half inch nose cap holddown bolt's longitudinal axis.

NASA/DOD/DOE Pyrotechnic Device

TITLE: Transfer Line - Quick Release Flexible Explosive

AGENCY/CENTER: NASA Langley Research Center (LaRC)

PHYSICAL DATA:

CROSS SECTION OF QUICK-RELEASE FLEXIBLE EXPLOSIVE TRANSFER LINE

CONTRACTOR: Teledyne McCormich Selph

SUBCONTRACTOR: Same as Contractor above.

DEVICE IDENTIFICATION NUMBER:

n/a

PURPOSE:

Transfer an explosive stimulus from the aircraft to an explosive bolt.

PREVIOUS USAGE:

The flexible explosive transfer line has had considerable application to military aircraft escape systems.

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

An explosive input from the aircraft detonates the tip of this transfer line, which focuses the explosive input to the explosive cord. The explosive signal propagates down the length of the line to initiate an identical tip on the opposite end. The exploding of this tip provides the input to the explosive bolt. All explosive products within the line are contained by the fiberglass overbraid.

The design challenge was to retain the quick release transfer fittings and end tip explosive products on functioning to prevent harm to the crew or the aircraft. Since the three small posts of the electrical connector could not withstand the explosive forces generated, the approach used was to carry the loads into the fitting through another path. The aluminum protector/flare tube projects beyond the tip on the flexible line and is inserted into a fitting either on the bolt or on the manifold as part of the assembly. As each tip explodes, this tube flares and locks into the internal shoulder of the male fitting cavity. The protector/flare tube also protects the end tip from potential damage during repeated assembly and disassembly.

DOCUMENTATION: Bement, Laurence J.; Jahsman, Dirk and Schimmel, Morry L. "Helicopter In-Flight Stores Jettison." Presented at the 1989 SAFE Symposium, Las Vegas, Nevada, December 4-8, 1989.

SERVICE LIFE:

SHELF: 7 years

OPERATIONAL: 5 years

ADDITIONAL REFERENCES:

n/a

ADDITIONAL COMMENTS:

Service life on this component must be limited to allow a demonstration within a previously unknown environment, including ground crew handling and flight conditions.

Design and development emphasis was placed on proving functional margins for all aspects of use and interfaces. Previously

NASA/DOD/DOE Pyrotechnic Device

qualified design principles and hardware were employed to reduce the number of tests to demonstrate reliability and to eliminate the need for environmental qualification.

SPECIAL FEATURES:

These transfer lines incorporate quick-release, fully contained connectors, comparable to electrical fittings.

NASA/DOD/DOE Pyrotechnic Device

TITLE: Transfer Line - RSRA Shielded MD Cord (Rigid & Flexible)

AGENCY/CENTER: NASA Langley Research Center (LaRC)

PHYSICAL DATA:

SECTION OF RIDGID EXPLOSIVE TRANSFER LINE (1 GRAIN = 65 MG)

CONTRACTOR: Teledyne McCormick Selph

SUBCONTRACTOR: n/a

DEVICE IDENTIFICATION NUMBER:

n/a

PURPOSE:

These lines are assembled with free-turning nuts at each end into manifolds, like high-pressure plumbing to communicate an explosive signal throughout aircraft systems. This is the redundant system employed by the RSRA to initiate the labeled components.

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

Cobra, F-11, B-1, F-14, F-15, T-28

OPERATIONAL DESCRIPTION:

A low-load, silver-sheathed explosive cord (mild detonating cord (MDC)) is contained in a 3/16 diameter, 0.030-inch wall thickness steel tube, which contains all explosive products on functioning. The mechanically swaged and welded end fittings (identical on each end) provide for reliable explosive transfer from unit to unit. The figure shows a similar view of a flexible explosive transfer line, which has multiple layers of fiberglass overbraid and polyurethane tubing on the lead-sheathed cord to contain the explosive products. The overbraid is potted into the end fitting. An explosive stimulus input initiates the explosive in the booster tip, which is housed in a 0.005-inch wall thickness, 302 stainless steel cup. The explosive propagation passes through the tip, is focused by the ferrule charge to the small-diameter explosive core. The velocity of propagation through the MDC, which is hexanitrostilbene (HNS), is typically 22,000 feet/second (7,000 meters/second). On arrival at the opposite end of the line, the output tip is initiated, producing high-velocity steel fragments (7 to 11,000 ft/sec) and a high-pressure gas wave.

ENERGY SOURCE:

TYPE OF INITIATION: Explosive transfer

CHARGE MATERIALS:

See Operational Description above.

ELECTRICAL CHARACTERISTICS:

n/a

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -25°F
High +200°F

PRESSURE: n/a

DYNAMICS:

SHOCK: previously qualified on a variety of U.S. Military fighter aircraft

VIBRATION: previously qualified on a variety of U.S. Military fighter aircraft

QUALIFICATION:

DOCUMENTATION: Bement, Laurence J.: "Helicopter (RSRA) In-Flight Escape System Component Qualification" Presented at the Tenth Symposium on Explosives and Pyrotechnics, San Francisco, CA, February 14-16, 1979.

SERVICE LIFE:

SHELF: unlimited for rigid lines, based on supporting programs by U. S. Military.

OPERATIONAL: Unlimited for rigid lines, as above. Flexible lines limited to 5 years

ADDITIONAL REFERENCES:

n/a

NASA/DOD/DOE Pyrotechnic Device

ADDITIONAL COMMENTS:

An extensive evaluation was conducted with flexible lines for application to the RSRA rotorhead, sending a signal from the rotor hub, across the flexing rotor hinge, to the blade severance assembly. A total of 7 million cycles with $\pm 20^\circ$ flap and 40° twist were conducted, followed by removing specimens after scheduled flight hours. These lines and associated manifolds were previously qualified on other aircraft systems, as described in table 2.

NASA/DOD/DOE Pyrotechnic Device

TITLE: Transfer Unit - RSRA Rotary

AGENCY/CENTER: NASA Langley Research Center (LaRC)

PHYSICAL DATA:

ROTARY TRANSFER UNIT

CONTRACTOR: Sikorsky Aircraft

SUBCONTRACTOR: Teledyne McCormick Selph

DEVICE IDENTIFICATION NUMBER:

n/a

PURPOSE:

This system provided the sequenced severance of the five RSRA rotor blades, assuring that the rotor blades were released so that their trajectories were away from the aircraft.

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

none

OPERATIONAL DESCRIPTION:

Inputs from explosive transfer lines into the sequencers (mounted on the non-rotating portion of the aircraft) thrust firing pin assemblies into an interference path with fixed cams, mounted on the bottom of the main rotor shaft. When these firing pin assemblies were struck, an explosive transfer initiation signal was transmitted to redundant sets of three cam thrusters. The cam thrusters then projected an interference with two sets of five firing pin assemblies (one for each rotor blade), mounted on a rotating assembly to the main rotor shaft. This arrangement assured that the cam thrusters would be positioned prior to arrival of the rotating firing pin assemblies and to initiate blade severance in a three/two sequence at positions relative to the aircraft.

NASA/DOD/DOE Pyrotechnic Device

TITLE: Valve - Atlas LO₂ Sensing Line Shutoff

AGENCY/CENTER: NASA Lewis Research Center (LeRC)

PHYSICAL DATA:

ATLAS LO₂ SENSING LINE SHUTOFF VALVE

CONTRACTOR: General Dynamics Space Systems Division (GDSSD)

SUBCONTRACTOR: Conax Corporation

DEVICE IDENTIFICATION NUMBER:

Contractor Spec. 69-06011

PURPOSE:

To close a sensing line by pyrotechnically actuating a normally open valve to the closed position and thereby shutting off the line.

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

Expendable Launch Vehicles: Atlas Centaur Vehicles through AC-68

OPERATIONAL DESCRIPTION:

The valve is actuated at event time by electrical power to the pyro cartridge bridgewire. The heat sensitive charge in contact with the electrical bridge initiates the pyrotechnic firing. Gas pressure from the charge actuates the piston ram rod. The plug end on the rod jams the outlet channel closed in the valve and shuts off the sensing line.

ENERGY SOURCE:

TYPE OF INITIATION: Pressure cartridge with electrical bridgewire.

CHARGE MATERIALS:

Proprietary mix.

BOOSTER SEPARATION STAGING VALVE

CONTRACTOR: General Dynamics Space Systems Division (GDSSD)

SUBCONTRACTOR: Conax Corp.

DEVICE IDENTIFICATION NUMBER:
Contractor Spec. 27-04304

PURPOSE:

To open a flow line by pyrotechnically actuating a normal closed valve located between a pneumatic source and pressure operated unlatching mechanisms.

NASA/DOD/DOE Pyrotechnic Device

PREVIOUS USAGE:

Expendable Launch Vehicles: Atlas Centaur Vehicles through AC-68

OPERATIONAL DESCRIPTION:

The valve is actuated at event time by electrical power to the pyro cartridge bridgewire. The heat sensitive charge in contact with the electrical bridge initiates the pyrotechnic firing. Gas pressure from the charge actuates the piston ram rod. The cutter disk on the rod shears the valve diaphragm allowing pneumatic flow of the working gas. The pneumatic gas flows to the unlatching mechanisms.

NASA/DOD/DOE Pyrotechnic Device

TITLE: Valve - External Tank Tumble

AGENCY/CENTER: NASA Marshall Space Flight Center (MSFC)

PHYSICAL DATA:

PYROTECHNIC-OPERATED TUMBLE VALVE

CONTRACTOR: Martin-Marietta Corporation

SUBCONTRACTOR: Pyronetics

DEVICE IDENTIFICATION NUMBER:

Martin PD 4700193-020

PURPOSE:

To vent the gases from the LO2 tank and, after separation, to direct the gases so that it causes the ET to tumble.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic Device

OPERATIONAL DESCRIPTION:

The "normally closed" pyrotechnic-operated tumble valve is activated by a pressure cartridge. When the pressure cartridge is activated, the pressure generated drives the valve actuator piston against the ram assembly which shears the closure member from the inlet body at the valve. The ram assembly and sheared member are propelled into the containment chamber where they are retained by wedging the externally tapered projection of the ram assembly into the internally tapered opening in the end cap. This action unblocks the passage in the valve to permit venting of the LO2 tank. The steel bellows in the actuator assembly seals cartridge pressure gas and contaminants from the valve flow passage.

ENERGY SOURCE:

ADDITIONAL COMMENTS:

All fire current: 1 amp for 10 ms; No-fire current: 0.1 amp for 5 minutes minimum; Bridgewire resistance: 1.8 ± 0.2 Ohms; Insulation resistance 50 megohms min at 500 volts DC.

NASA/DOD/DOE Pyrotechnic System

TITLE: Bolt System - Centaur Nose Fairing Separation

AGENCY/CENTER: NASA Lewis Research Center (LeRC)

PHYSICAL DATA:

NOSE FAIRING SEPARATION SYSTEM

CONTRACTOR: General Dynamics Space Systems Division (GDSSD)

SUBCONTRACTOR: No system vendor; only device vendors (see each device).

SYSTEM IDENTIFICATION NUMBER:

no system number; refer to specific components (devices).

PURPOSE:

To unlatch the halves of the bisegmented nose fairing from each other and from the Centaur vehicle by pyrotechnically generated pressure on internal pistons forcing latch bolts to fail in tension for separation and jettison of the fairing.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

Expendable Launch Vehicles:
Atlas Centaur Vehicles through AC-68

OPERATIONAL DESCRIPTION:

Battery power is issued at event time by the control units to the pressure cartridge (PC) detonators installed in each separation bolt end. Activation of the PC's develops pressure on the pistons and force amplifiers in the bolts causing bolt tension failure. This failure of the fasteners holding the fairing halves together and to the vehicle allows separation and jettison of the nose fairing, on separable aft hinges, by spring actuators.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -100° F
High +200° F

PRESSURE: n/a

LIST OF DEVICES:

Separation Bolt; GDSSD 55-07057

ADDITIONAL COMMENTS:

One pressure cartridge per separation bolt is sufficient to fail the bolt. See separation bolt listed under devices for more operational description.

NASA/DOD/DOE Pyrotechnic System

TITLE: Bolt System - ET Gaseous H₂ Vent Umbilical Disconnect

AGENCY/CENTER: NASA Marshall Space Flight Center (MSFC)

PHYSICAL DATA:

EXTERNAL TANK (ET) GASEOUS HYDROGEN (GH₂) VENT UMBILICAL
DISCONNECT BOLT SYSTEM

CONTRACTOR: Martin-Marietta Corporation

SUBCONTRACTOR: Martin-Marietta Corporation

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To disconnect a facility GH₂ vent umbilical assembly from the ET intertank.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

A separation bolt is used to secure a facility GH2 vent umbilical assembly to the ET intertank. The facility portion of the umbilical assembly is referred to as the ground carrier assembly. The separation bolt attaches the ground carrier to the intertank. At liftoff, the pressure cartridges are initiated, which causes the separation bolt to separate. Upon separation the ground carrier assembly drops away from the vehicle.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low Ambient

High -200° F (after propellant loading)

PRESSURE: Refer to specific components (devices).

NASA/DOD/DOE Pyrotechnic System

TITLE: Bolt System - Ground Wind Damper Release Separation

AGENCY/CENTER: NASA Lewis Research Center (LeRC)

PHYSICAL DATA:

CONTRACTOR: General Dynamics Space Systems Division (GDSSD)

SUBCONTRACTOR: No system vendor; only device vendors (see each device).

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To disconnect the ground wind damper boom from the vehicle at launch by failing the separation bolts that join the boom to the counter weight support cable and thereby, releasing the boom to swing downward, disengaging the pin connection, and pivoting clear.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

Expendable Launch Vehicles:

Latter Atlas Centaur Vehicles through AC-68

OPERATIONAL DESCRIPTION:

The damper stabilizes the vehicle by absorbing oscillatory motion induced by ground wind during periods when the mobile service tower is rolled back from the vehicle for testing or launch. At launch the ground control unit switches electric power to the pressure cartridges at the two separation bolts in a release fitting. The fitting ties the boom support cable to a counterweight. Activation of the cartridges fail the bolts freeing the support cable. The boom pivots downward disengaging from the vehicle and locks onto the snubber/catcher clear of the vehicle.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -100° F
High +200° F

NASA/DOD/DOE Pyrotechnic System

TITLE: Bolt System - SRB/ET Aft Separation

AGENCY/CENTER: NASA Marshall Space Flight Center (MSFC)

PHYSICAL DATA:

VIEW ROTATED 180°

SRB/ET AFT SEPARATION BOLT SYSTEM

CONTRACTOR: USBI

SUBCONTRACTOR: USBI

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To provide aft SRB/ET separation by the use of three aft struts held together at the separation plane by three separation bolts.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

The aft SRB/ET separation system consists of three aft separation bolts located in three aft struts with two NSI pressure cartridges per separation bolt, six per SRB/ET separation system. The struts are held together at the separation plane by the separation bolts. The bolts are fractured at the preselected fracture groove when the NSI pressure cartridges are initiated. The separation sequence begins when the internal pressure of both SRMs is below 50 psi. At that point redundant separation signals are sent to the aft struts which initiate the redundant NSI pressure cartridges. The pressure produced by each NSI pressure cartridge acts against a primary piston. The force of the primary piston is amplified through the compression of soft lead couplings. The amplified force is then applied to a secondary piston. The redundant side of the bolt also applies a amplified force to its secondary piston. The two secondary pistons reacting against each other or against the shoulder of the opposite insert, depending on the simultaneity of the firing of the two cartridges, cause the bolt housing to fail in tension. The sudden release of tension and the extra margin of force/piston overstroke will accelerate both ends of the bolt to approximately 100 foot/second. Crushable honeycomb is installed in both ends of the strut to decelerate and stop both ends of the separation bolt.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F

High +120° F for 4 hours

PRESSURE: Refer to specific components (devices).

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To provide separation at the SRB/ET forward interface by way of a separation bolt.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

When the SRB and ET separate, the separation bolt is fractured at the predetermined separation plane allowing separation of the SRB/ET forward interface. The separation sequence begins when the internal pressure of both SRMs are below 50 psi. At that point redundant separation signals are sent to the forward attach points which initiate the redundant NSI pressure cartridges. The pressure produced by each NSI pressure cartridge acts against a primary piston. The force of the primary piston is amplified through the compression of soft lead couplings. The amplified force is then applied to a secondary piston. The redundant side of the bolt also applies a amplified force to its secondary piston. The two secondary pistons reacting against each other or against the shoulder of the opposite insert, depending on the simultaneity of the firing of the two cartridges, cause the bolt housing to fail in tension. The sudden release of tension and the extra margin of force/piston overstroke will accelerate both ends of the bolt to approximately 100 foot/second. Crushable honeycomb is installed in the SRB thrust fitting and ET bolt catcher to decelerate and stop both ends of the separation bolt.

All pyro circuits are fully redundant and conform to the requirements of MIL-STD-1512.

NASA/DOD/DOE Pyrotechnic System

TITLE: Cutter System - Marman Band Bolt

AGENCY/CENTER: NASA Goddard Space Flight Center (GSFC)

PHYSICAL DATA:

MARMAN BAND BOLT CUTTER

CONTRACTOR: McDonnell Douglas (MDAC)

SUBCONTRACTOR: n/a

SYSTEM IDENTIFICATION NUMBER:

MDAC 1B9975 Gas Carrier Ejection System

PURPOSE:

Redundant pyrotechnic bolt cutters are used to shear two bolts that are 180° apart. When either of the bolt cutters is fired, it shears the bolts which in turn releases the Marman band from the payload and initiates the deployment of the payload.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

Similar to flight qualified bolt cutter assembly currently used on all models of NASA Delta launch vehicle as well as the USAF Block 5-D program.

OPERATIONAL DESCRIPTION:

The bolt cutter assembly consists of a cutter and electrically initiated squibs. The squibs are installed in the cutter at the supplier facility and are not removed thereafter. Two 1B99775 bolt cutter assemblies are used for redundancy in severing the bolts which secure the clamp band assembly. The squibs conform to MIL-STD-1512; they have a maximum No-Fire current of 1 amp, 1 watt for 5 minutes. The squibs also have a single bridge wire and are in compliance with Shuttle requirements; however, they are not NSI's. Redundancy is provided by the use of one cutter on each of the clamp bolts. Cutting of either bolt will permit the clamp band to release the payload.

The cartridge used in the 1B99775 bolt cutter meets the design requirements of MIL-STD-1512. It is a 1 amp 1 watt EEDC and contains a design feature of 25,000 volts protection for ESD. Initiation of the squibs creates gas pressure which drives the cutter blade through the clamp bolt.

TITLE: Cutter System - REFLEX Cap

AGENCY/CENTER: NASA Goddard Space Flight Center (GSFC)

PHYSICAL DATA:

REFLEX PAYLOAD CAP CUTTER MECHANISM

CONTRACTOR: n/a

SUBCONTRACTOR: IRECO Incorporated

SYSTEM IDENTIFICATION NUMBER:
Refer to List of Devices (below)

PURPOSE:
The cap cutter removes the cap that seals the vacuum on the mass spectrometer.

PREVIOUS USAGE:
n/a

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

The cap cutter operates by firing two squibs that rotate sixteen cutting wheels that release the cap and allows a spring-loaded arm to lift it from the opening. The squib hammer strikes the lugs A fastened to ears B on ring C. C turns counter-clockwise. As a result of the cam action, the cutter wheels are driven radially inward and break through the aluminum wall of the cap. One squib exerts enough force to operate the device, however, two are used as a precaution if one should fail. The cap is retained by the cutter block.

NASA/DOD/DOE Pyrotechnic System

TITLE: Cutter System - SRB Main and Drogue Parachute Line

AGENCY/CENTER: NASA Marshall Space Flight Center (MSFC)

PHYSICAL DATA:

SOLID ROCKET BOOSTER MAIN AND DROGUE PARACHUTE LINE CUTTER SYSTEM

CONTRACTOR: USBI

SUBCONTRACTOR: USBI

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To successfully deploy the SRB parachute by the use of a family of mechanically initiated pyrochemical time delay cutters.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

The cutters use the same mechanical components but different time delay cartridges. Two cutters for each function provide redundancy in the system.

Lanyards attached to the pilot parachute and to the firing mechanism of the cutters, which are attached to the drogue parachute pack, fire the cutters. The pilot parachute is now able to pull the drogue pack off the drogue parachute, which activates the first and second stage time delay cutters and allows the drogue parachute to be deployed to 60 percent of its drag area. The first stage cutters sever the reefing lines for 80 percent deployment at seven seconds after drogue cutter activation. At 12 seconds, the second stage cutters sever the second set of reefing lines, allowing the parachute to deploy to 100 percent.

At separation from the forward skirt, the frustum strips the three main parachute packs from the three main parachutes. This event allows the main parachutes to deploy to 19 percent of total drag area and activates the first and second stage reefing line cutters. The first stage cutter in each of the three main parachutes severs the reefing lines, which allows the main parachutes to deploy to 45 percent of total drag area at 10 seconds after main cutter activation. At seventeen seconds after main cutter activation, the second stage reefing line cutters allow the main parachutes to deploy to 100 percent of total drag area.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F

High +200° F for 4 hours

PRESSURE: Refer to specific components (devices).

LIST OF DEVICES:

- 18 Parachute cutters:
- 2 Cut Loop Drogue, 0 sec. delay, 10320-0001-801

TITLE: Destruct Ordnance System - Atlas

AGENCY/CENTER: NASA Lewis Research Center (LeRC)

PHYSICAL DATA:

RANGE-SAFETY-COMMAND ATLAS DESTRUCT ORDNANCE SYSTEM

CONTRACTOR: General Dynamics Space Systems Division (GDSSD)

SUBCONTRACTOR: No system vendor; only device vendor (see each device).

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To terminate and Atlas flight in an emergency condition, as when the vehicle flight varies from the allowable course or goes into tumble mode, by explosive rupture of the vehicle tanks and dispersion of propellants.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

Expendable Launch Vehicle:
Atlas Centaur Vehicles through AC-68

OPERATIONAL DESCRIPTION:

Upon radio command issued by the Range Safety Officer, the control unit switches battery power to the two detonators in the safe/arm destructor unit. Activation of the detonators (at least one) initiates firing of the booster and the destruct charge which is mounted against the vehicle tank. The resulting explosion ruptures the fuel and the oxygen tanks and disperses the propellants to prevent possible ground impact catastrophe.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -100° F
High +200° F

NASA/DOD/DOE Pyrotechnic System

TITLE: Destruct System - External Tank (ET) Range Safety

AGENCY/CENTER: NASA Marshall Space Flight Center (MSFC)

PHYSICAL DATA:

EXTERNAL TANK (ET) RANGE SAFETY DESTRUCT SYSTEM

CONTRACTOR: Martin-Marietta Corporation

SUBCONTRACTOR: Martin-Marietta Corporation

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices)

PURPOSE:

To allow the range safety officer to intentionally destroy the ET in the event of flight path deviation, improper vehicle parameters, or inadvertent separation.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

The ET range safety system is an airborne command destruct system for the ET. Ground commands arm the Safety and Arming (S&A) device at 4 minutes, 58 seconds prior to ignition.

When flight termination (destruct) action is taken, the nominal Shuttle Range Safety Command System usage will consist of transmission of the "Arm" command several times, a pause of one second, and then the transmission of the "Fire" command several times or until the destruct action takes place. The "Fire" command triggers the Pyrotechnic Initiator Controller (PIC) which initiates the NSD. The NSD detonation propagates through the S&A device, transfer charge, Confined Detonating Fuse (CDF) manifold, and CDF assemblies to the Linear Shaped Charge (LSC) assembly. Redundancy is achieved in the LSC assembly by initiating the LSCs at both ends. The detonation output of the LSC assembly cuts both the LO2 and LH2 tanks, causing the destruction of the ET.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F

High +165° F for 4 hours

PRESSURE: Refer to specific components (devices).

NASA/DOD/DOE Pyrotechnic System

TITLE: Destruct System - Inadvertent Separation (ISDS)

AGENCY/CENTER: NASA Goddard Space Flight Center (GSFC)/Wallops Flight Facility (WFF)

PHYSICAL DATA:

INADVERTENT SEPARATION DESTRUCT SYSTEM

CONTRACTOR: EER Systems Corporation

SUBCONTRACTOR: EER Systems Corporation

SYSTEM IDENTIFICATION NUMBER:

n/a

PURPOSE:

This system is used on the Conestoga launch vehicle to terminate the flight of stages which separate from the vehicle stack-up prematurely. By utilizing this type of system, it is not required to utilize a complete command system for flight termination on each individual powered stage.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

Conestoga/COMET program

OPERATIONAL DESCRIPTION:

During final vehicle processing mechanical SAFE pins are removed from the Lanyard Delay Detonators (LDD) and the Interrupter. Immediately prior to launch the Interrupter is remotely ARMED (can also be remotely SAFED). During flight should a stage separate prematurely, the LDD's would be initiated (lanyards on the LDD's are attached to the core vehicle which contains the command Flight Termination System). Following initiation of the LDD's, the Ordnance Transfer Assembly (OTA) lines will be initiated (Flexible Confined Detonating Cord (FCDC) is used as the OTA lines for this system). The OTA lines are routed through the Interrupter and through two-in-one manifolds to the destruct charge. For normal stage separations, an onboard command can be issued to SAFE the Interrupter thereby preventing the destruct charge from being initiated.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low n/a
High n/a

PRESSURE: n/a

LIST OF DEVICES:

Lanyard Delay Detonators (LDD), Interrupter, Flexible Confined Detonating Cord, two-in-one-out manifold, appropriate destruct charge (mission unique item).

QUALIFICATION DOCUMENTATION:

Components Qualified at vendor level.

ADDITIONAL REFERENCES:

n/a

ADDITIONAL COMMENTS:

System permits flight termination of a stage from either a ground command or from the ISDS. By utilizing the Interrupter, it is possible to prevent destruct action during normal stage separations thereby minimizing debris. System is redundant to meet Range Safety requirements.

PURPOSE:

To cut the Solid Rocket Booster (SRB) 70% of its length and destroy the SRB in flight in the event of flight deviation.

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

The destruct assembly has one Linear Shaped Charge (LSC) train initiated by redundant Confined Detonating Fuse (CDF) assemblies and RDX transfer boosters. The destruct assembly consist of one CDF/Linear Shpaed Charge (LSC) connector, either five FWC or six - SC assemblies, four or five LSC/LSC connectors, 72 mounting plates, and 72 mounting saddles. The CDF assemblies and RDX transfer boosters ignite the LSC through the CDF/LSC connector. The LSC is held in place by the mounting plates and saddles and connected together by the LSC/LSC connectors. The LSC will cut the SRB 70% of its length.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F for 12 hours

High +200° F for 2 hours

PRESSURE: Output: the LSC assembly shall sever a 0.125 inch 2219-T87 AL plate and a 0.5 inch D6AC 180 KSI steel plate with a 0.375 inch separation between the plates and at a LSC assembly standoff of 0.84 inch above the Al plate.

TITLE: Destruct System - Solid Rocket Booster (SRB) Range Safety

AGENCY/CENTER: NASA Marshall Space Flight Center (MSFC)

PHYSICAL DATA:

SOLID ROCKET BOOSTER (SRB) RANGE SAFETY DESTRUCT SYSTEM

CONTRACTOR: USBI

SUBCONTRACTOR: USBI

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To allow the range safety officer to intentionally destroy the SRB in the event of flight path deviation, improper vehicle parameters, or inadvertent separation.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

The SRB range safety system is an airborne command destruct system for the SRB. Ground commands arm the Safety and Arming (S&A) device at 4 minutes, 58 seconds prior to ignition. The (S&A) device is safed at SEPCUE.

When flight termination (destruct) action is taken, the nominal Shuttle Range Safety Command System usage will consist of transmission of the "Arm" command several times, a pause of one second, and then the transmission of the "Fire" command several times or until the destruct action takes place. The "Fire" command triggers the Pyrotechnic Initiator Controller (PIC) which initiates the NSD. The NSD detonation propagates through the S&A device, transfer charge, Confined Detonating Fuse (CDF) manifold, and CDF assemblies to the destruct assembly. The detonation output of the destruct assembly cuts 70 percent of the length of the SRM, causing the destruction of the SRB.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F for 12 hours

High +165° F for 4 hours

PRESSURE: Refer to specific components (devices).

LIST OF DEVICES:

2 NSDs, SEB26100094-201

1 Safety and Arming (S&A) Device, 10311-0001-801

7 CDF Assemblies, 10314-0001-123 thru 10314-0001-129

NASA/DOD/DOE Pyrotechnic System

TITLE: Escape System - F-111 Crew Module

AGENCY/CENTER: Submitted by NASA Langley Research Center (LaRC),
developed by USAF/Wright Patterson AFB

PHYSICAL DATA:

CONTRACTOR: General Dynamics

SUBCONTRACTOR: McDonnell Aircraft Company

SYSTEM IDENTIFICATION NUMBER:
n/a

PURPOSE:
Provide emergency in-flight escape for two crewmen from the F-111 aircraft.

PREVIOUS USAGE:
n/a

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

Either crewman can initiate escape at each seat by pulling an ejection handle, which initiates explosive transfer lines for the remainder of the system. Inertia-lock reels position the crew for ejection. Actuators provide emergency oxygen and cabin pressurization. Flexible linear shaped charge cuts splice plates between the crew module and the aircraft. Guillotines sever secondary controls and antenna leads. A solid rocket motor propels the crew module from the aircraft. A stabilization-brake chute catapult deploys a parachute for increasing crew module drag. A q-actuated selector and g-sensor initiator select the proper time delay prior to actuating a barostat lock initiator. The barostat lock initiator assures parachute deployment at an altitude of approximately 15,000 feet. A recovery parachute catapult deploys a parachute at a velocity adequate for proper bag strip-off. Reefing line cutters disreef the parachute after line stretch. Recovery parachute repositioning release retractors permit repositioning of the bridle cable for proper crew module touchdown attitude. Explosive valves release pressurized gas for inflating an impact attenuation bag.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -65°F
High +425°F

PRESSURE: F-111 altitude envelope

ADDITIONAL COMMENTS:

Gemini pioneered in the use of rigid explosive transfer lines, known as shielded mild detonating cord (SMDC) and the use of high-temperature resistant explosive material (Dipicramide or DIPAM).

NASA/DOD/DOE Pyrotechnic System

TITLE: Escape System - Mercury Capsule

AGENCY/CENTER: NASA Langley Research Center (LaRC)

PHYSICAL DATA:

CONTRACTOR: McDonnell Aircraft Company

SUBCONTRACTOR: n/a

SYSTEM IDENTIFICATION NUMBER:
n/a

PURPOSE:

Provide for manned space flight (ballistic and orbital), deorbit and water recovery.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

A solid-propellant rocket tower on top of the capsule provided for escape on the pad, following release of a Marman band separation joint. Normal flights utilized this separation joint to free the capsule from the Atlas D launch vehicle. The escape tower had to be released early in the normal flight sequence. Mercury used electrical-hotwire initiation systems, along with ballistic hot gas (500 psi tubing) that communicated an initiation signal to subsystems. Mercury also perhaps accomplished the earliest use of linear explosive cord. Two strands of 5 grains/ft cord were used to break 70 prenotched titanium bolts around the periphery of the entrance hatch, which provided emergency and routine egress. Following reentry, the capsule descended on a pyrotechnically deployed parachute.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low n/a
High n/a

PRESSURE: orbital

ADDITIONAL COMMENTS:

n/a

NASA/DOD/DOE Pyrotechnic System

TITLE: Escape System - Rotor Systems Research Aircraft (RSRA)
Inflight

AGENCY/CENTER: NASA Langley Research Center (LaRC)

PHYSICAL DATA:

RSRA EMERGENCY ESCAPE SYSTEM

CONTRACTOR: Sikorsky Aircraft

SUBCONTRACTOR: Teledyne McCormick Selph Stanley Aviation

SYSTEM IDENTIFICATION NUMBER:
n/a

PURPOSE:

This system provided two emergency operational capabilities: Rotor blade severance and return to base on the wing; and in-flight escape for three crew members.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

None. This is the first operational in-flight escape system for a helicopter.

OPERATIONAL DESCRIPTION:

A single overhead handle provided for the initiation of programmed severance of the rotor blades to allow the blades to be jettisoned away from the path of the aircraft. Either pilot could initiate escape by pulling a handle on the front edge of each seat. The blade severance system described above was employed, overhead canopies were explosively fractured, the cyclic sticks released to hinge out of the path of the crewmembers, and the crewmembers were sequentially extracted. The Flight Engineer faced aft. All three members were clear of the aircraft in 2.3 seconds. The figure describes the system's major functions.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -65°F
High +200°F

PRESSURE: n/a

LIST OF DEVICES:

F-111 initiation handle, rigid and flexible explosive transfer lines (SMDC and FCDC, respectively), pin pullers, canopy fracture systems, cam thrusters, firing pin assemblies, blade severance assemblies, and extraction seat, which is made up of a variety of components: mechanical initiators, hot gas generators, buckle release, barostat actuator, extraction rocket, pendant line cutter, seat belt release thruster and FCDC.

QUALIFICATION DOCUMENTATION:

Bement, Laurence J.: "Rotor Systems Research Aircraft (RSRA) Canopy Explosive Severance/Fracture" Presented at the Ninth Symposium on Explosives and Pyrotechnics, September 15-16, 1976.
Bement, Laurence J.: "Helicopter (RSRA) In-Flight Escape System Component Qualification" Presented at the Tenth Symposium on Explosives and Pyrotechnics, San Francisco, CA, February 14-16, 1979.

Bement, Laurence J.: "Helicopter Emergency Escape" SAFE Journal - Vol. 9, No. 3, Fall Quarter, 1979.

ADDITIONAL REFERENCES:

n/a

ADDITIONAL COMMENTS:

The approach for qualification of this system was to minimize the quantity of device and system-level testing through an emphasis on functional margin demonstrations during development and escape trajectory computer analysis. The result was that the number of component tests for environmental testing were as few as 10 with only 5 system-level demonstrations. That is, a total of 13 extractions were made, rather than 72 (24 consecutive, successful tests from each position) as required by military specifications.

NASA/DOD/DOE Pyrotechnic System

TITLE: Igniter System - NOAA Apogee Kick Motor Safe/Arm

AGENCY/CENTER: NASA Goddard Space Flight Center (GSFC)

PHYSICAL DATA:

CONTRACTOR: n/a

SUBCONTRACTOR: Thiokol

SYSTEM IDENTIFICATION NUMBER:

Refer to List of Devices (below)

PURPOSE:

Ignites the rocket motor by spraying the motor propellant grain with hot pyrotechnic material through igniter nozzles.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

The Safe/Arm output initiates the explosive transfer assembly which produces a high pressure pulse at each of the two bulkhead initiator interfaces. A pressure pulse initiates the TBI shock sensitive PETN charge which transfers a shock pulse through the TBI bulkhead metal without rupturing the bulkhead. This prevents rocket motor case combustion gases from leaking through the initiator. The charge initiates a PETN receptor charge and pyrotechnic charge in the TBI. The TBI output initiates the igniter assembly which produces a pyrotechnic output that ignites the toroidal igniter. The toroidal igniter ignites the rocket motor by spraying motor propellant grain with hot pyrotechnic material through igniter nozzles.

HYDROGEN BURNOFF IGNITER

CONTRACTOR: Lockheed Space Division-Shuttle Processing Contractor/
KSC

SUBCONTRACTOR: Pacific Scientific.

SYSTEM IDENTIFICATION NUMBER:

P/N 51-1151-2 NASA/KSC

PURPOSE:

The H₂ burn igniter ignites at T-10 seconds to burn off free hydrogen at the main engine level prior to main engine ignition. This prevents the accumulation of hydrogen and an explosive overpressure.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

The system uses six hydrogen igniters. Two igniters aimed at each of the three main engines throw hot Zirconium particles under the engine bell for 8 to 12 seconds, igniting the free hydrogen as it is released. Each igniter is initiated by an NSI by ground command.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -65°F
High +150°F

PRESSURE: n/a

LIST OF DEVICES:

NSI, H2 burn-off igniter

QUALIFICATION DOCUMENTATION:

80K50593 hydrogen burn-off igniter specification

ADDITIONAL REFERENCES:

ADDITIONAL COMMENTS:

Redundancy is achieved by providing two H2 burn-off igniters with an independent firing system for each main engine.

PHYSICAL DATA:

SOLID ROCKET MOTOR (SRM) IGNITION SYSTEM

CONTRACTOR: Thiokol Corporation

SUBCONTRACTOR: Thiokol Corporation

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To ignite and prevent the premature ignition of the SRM.

PREVIOUS USAGE:

Minuteman, second stage

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

At 4 minutes, 58 seconds before launch, a signal is sent to the Safety and Arming (S&A) device to rotate the booster-barrier rotor from the SAFE to the ARM position. The S&A device, when in the SAFE position, will prevent the premature ignition of the SRM. When the S&A device is in the ARM position, the 2 holes in the barrier rotor plate are aligned with the output end of the initiators and the booster charge in the S&A device. Charge commands are sent to the ignition pyrotechnic initiator controllers (PICs) at t-15 seconds in the launch count down. Redundant fire commands are sent to the triggers of two PICs at time zero. The PIC capacitors are discharged into the SRM Ignition Initiator (SII) bridgewires, initiating the output charges. The output of the redundant NSIs passes through the booster-barrier holes and ignites the S&A booster charge, which ignites the SRM igniter.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F
High +120° F

PRESSURE: Refer to specific components (devices).

NASA/DOD/DOE Pyrotechnic System

TITLE: Ignition System - SRB/ET Booster Separation Motor

AGENCY/CENTER: NASA Marshall Space Flight Center (MSFC)

PHYSICAL DATA:

CONTRACTOR: USBI

SUBCONTRACTOR: USBI

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To ignite the forward and aft SRB/ET separation motors which provide positive separation between the SRM and ET/Orbiter during structural separation.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

Eight BSMs, four forward and four aft, are ignited by two SRB/ET separation motor ignition systems. Redundant separation signals initiate two NSDs which propagates a shock wave through two CDF manifolds and eight CDF assemblies to eight CDF initiators mounted in the separation motors. The CDF initiators ignite the separation motor igniters which ignites the solid propellant and produces the required separation force.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F for 12 hours

High +190° F for 4 hours

PRESSURE: Refer to specific components (devices).

LIST OF DEVICES:

2 NSDs, SEB26100094-201

2 Confined Detonating Fuse (CDF) Manifolds, 10312-0001-102 thru 10312-0001-105

TITLE: Interrupter System - Ordnance Transfer Assembly (OTA)

AGENCY/CENTER: NASA Goddard Space Flight Center (GSFC)/Wallops Flight Facility (WFF)

PHYSICAL DATA:

CONTRACTOR: EER Systems Corporation

SUBCONTRACTOR: Pacific Scientific

SYSTEM IDENTIFICATION NUMBER:

n/a

PURPOSE:

Provide a means to interrupt an Ordnance Transfer Assembly (OTA) explosive train (Flexible Confined Detonating Cord (FCDC) is used as the OTA in this system). In the ARM position, this device will permit transfer of the explosive train. In the SAFE position, this device will stop the transfer of the explosive train.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

Conestoga/COMET

OPERATIONAL DESCRIPTION:

FCDC lines (redundant) are inserted into input and output ports respectively. When properly torqued, the distance between explosive end tips of the FCDC's is approximately 0.5 inch. With the device in the ARM position, propagation of the FCDC lines is permitted. With the device in the SAFE position, propagation of the FCDC lines is not permitted as a barrier is placed between the FCDC explosive end tips. The device may be switched from ARM-to-SAFE or SAFE-to-ARM remotely by applying the proper external command.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -65°F
High +200°F

PRESSURE: n/a

LIST OF DEVICES:

QUALIFICATION DOCUMENTATION:

Qualified for the Conestoga/COMET program

ADDITIONAL REFERENCES:

PHYSICAL DATA:

HELICOPTER STORES JETTISON SYSTEM

DETAILS OF AIRCRAFT TO EXTERNAL STORE INTERFACE

CONTRACTOR: Teledyne McCormick Selph

SUBCONTRACTOR: Teledyne McCormick Selph

SYSTEM IDENTIFICATION NUMBER:

n/a

PURPOSE:

Provide for rapid, emergency release of helicopter side-mounted stores to enhance flight maneuverability.

PREVIOUS USAGE:

None

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

The system approach was to use two nonfragmenting explosive bolts mounted in each 600-pound store to interface with a simple plate on the aircraft. The bolts were initiated by flexible explosive transfer lines with electrical-type push rotate quick-release connectors.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low n/a
High n/a

PRESSURE: n/a

LIST OF DEVICES:

AH-1G (Cobra) helicopter initiation handle, standard rigid explosive transfer lines (SMDC), flexible explosive transfer lines, explosive manifold, and explosive bolts.

QUALIFICATION DOCUMENTATION:

Bement, Laurence J.; Jahsman, Dirk and Schimmel, Morry L. "Helicopter In-Flight Stores Jettison". Presented at the 1989 SAFE Symposium, Las Vegas, Nevada, December 4-8, 1989.

ADDITIONAL REFERENCES:

n/a

ADDITIONAL COMMENTS:

This system design emphasized operational simplicity, speed of assembly, ruggedness under military conditions, safety and reliability.

Design and development emphasis was placed on proving functional margins for all aspects of use and interfaces. Previously qualified design principles and hardware were employed to reduce the number of tests to demonstrate reliability and to eliminate the need for environmental qualification.

NASA/DOD/DOE Pyrotechnic System

TITLE: Nut System - NOAA V-Band Separation

AGENCY/CENTER: NASA Goddard Space Flight Center (GSFC)

PHYSICAL DATA:

NOAA PAYLOAD V-BAND SEPARATION NUT

CONTRACTOR: n/a

SUBCONTRACTOR: Hi-Shear, General Electric

SYSTEM IDENTIFICATION NUMBER:

Refer to List of Devices (below)

PURPOSE:

The ordnance actuated V-band is used to separate the spacecraft from the booster adapter at the proper point in the launch sequence.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

There are 2 mechanisms per separation band. The actuation of the single bridgewire pressure cartridge operates the separation or nut which releases the bolt holding the band halves together. Upon actuation, the release of tension in the bands moves the V-blocks off the flanges and the stages are free to separate.

AGENCY/CENTER: NASA Marshall Space Flight Center (MSFC)

PHYSICAL DATA:

SOLID ROCKET BOOSTER (SRB) MAIN PARACHUTE RELEASE NUT SYSTEM

CONTRACTOR: USBI

SUBCONTRACTOR: USBI

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To release the main parachute attach bolt on splashdown by way of a parachute release nut.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

At splashdown, a G-force type impact switch in the forward IEA of the SRB causes a fire command to be sent to the main parachute disconnect Pyrotechnic Initiator Controller (PIC). The PIC ignites a NSD which propagates through a Confined Detonating Fuse (CDF) manifold and six CDF assemblies to six CDF pressure cartridges installed in each of the six parachute release nuts. The parachute release nuts attach the three main parachutes to the SRB. When the pressure cartridges are fired, the pressure causes the parachute release nut to release the main parachute attach bolt. The attach bolt is ejected from the nut by the ejector and the tension in the main parachute lines.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F for 12 hours
High +190° F for a minimum of 4 hours.

PRESSURE: Refer to specific components (devices)

TITLE: Pin Puller System - BBXRT Launch Locking Mechanism

AGENCY/CENTER: NASA Goddard Space Flight Center (GSFC)

PHYSICAL DATA:

BBXRT PAYLOAD PIN PULLER FOR LAUNCH LOCKING MECHANISM

CONTRACTOR: n/a

SUBCONTRACTOR: Hi-Shear Technology, Inc.

SYSTEM IDENTIFICATION NUMBER:
Refer to List of Devices (Below)

PURPOSE:
Pyro Pin pullers unlock the Launch Locking Mechanism

PREVIOUS USAGE:
n/a

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

BBXRT spacecraft utilizes a pair of Pyro pin pullers for each release mechanism assembly for mechanical redundancy. Each pressure cartridge has redundant bridgewires. Either bridgewire activated, Pressure cartridge will actuate the Pin Puller. This redundant bridgewire pressure cartridge design meets the electrical requirements of NSI cartridge. When commanded, the pyro pin-puller shall fire uncontrolled sequence at the restraint mechanism. Redundant firing signals shall be applied through redundant bridgewires after a short delay. The cartridges shall have 2 independent bridgewires, either capable of initiating the charge including failure of the first bridgewire.

OPERATING TEMPERATURE/PRESSURE:

TITLE: Pin Puller System - Insulation Panel/Equipment Module Vent Door

AGENCY/CENTER: NASA Lewis Research Center (LeRC)

PHYSICAL DATA:

INSULATION PANEL AND EQUIPMENT MODULE VENT DOOR SYSTEM

CONTRACTOR: General Dynamics Space Systems Division (GDSSD)

SUBCONTRACTOR: Conax - for pin pullers

SYSTEM IDENTIFICATION NUMBER:

Refer to specific components in List of Devices (below)

PURPOSE:

To open a door in the equipment module and one at the insulation panel cavity forward end by pyro actuated pin pullers for venting purge gas from the compartments.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

Expendable Launch Vehicles: Atlas Centaur Vehicles through AC-68

OPERATIONAL DESCRIPTION:

Just prior to vehicle liftoff electrical power is supplied to the two on board pyro pin pullers. Each of the pin pullers has two detonator explosive cartridges. Activation of at least one cartridge per puller actuates the mechanism to pull the pin. The pins are retainers that hold spring loaded doors in the closed position. Upon retraction of the pins, the doors spring open to vent the purge gas from the equipment module compartment and the insulation panel cavity.

Type of initiation: NSI's. Shock: MIL-STD-810, Method 516.1, Procedure I (Figure 516.1-1). Vibration: Rockwell Spec. MC 325-0021 Paragraph 4.2.4.1.7 and 4.2.4.1.6. Bridgewire Resistance = $1.05 \pm 0.1 \Omega$ res. Operational Shelf Life: 10 years.

NASA/DOD/DOE Pyrotechnic System

TITLE: Release System - SRB/Mobile Launch Platform (MLP) Holddown

AGENCY/CENTER: NASA Marshall Space Flight Center (MSFC)

PHYSICAL DATA:

CONTRACTOR: USBI

SUBCONTRACTOR: USBI

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To holddown the SRBs prior to launch and allow for a quick release at launch.

PREVIOUS USAGE:

None

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

At t-15 seconds before launch, the (Pyrotechnic Initiator Controllers (PICs) are armed, and at t-0.30 seconds before launch, the PICs are discharged, initiating the NSD. The NSD detonates the frangible nut booster cartridge assembly, which separates the nut due to the detonation shock and the booster cartridge pressure. There are two NSD/frangible nut booster cartridge assemblies per frangible nut for redundancy, but it only takes one booster cartridge assembly to completely separate the frangible nut.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F

High +150° F

PRESSURE: Refer to specific components (devices).

LIST OF DEVICES:

8 NSD, SEB26100094-201

8 Frangible Nut Booster Cartridge Assemblies, 10307-0001-801

NASA/DOD/DOE Pyrotechnic System

TITLE: Separation System - BLACK BRANT

AGENCY/CENTER: NASA Goddard Space Flight Center (GSFC)/Wallops
Flight Facility (WFF)

PHYSICAL DATA:

BLACK BRANT SEPARATION SYSTEM

CONTRACTOR: Bristol Aerospace Limited

SUBCONTRACTOR: See Device Vendor

SYSTEM IDENTIFICATION NUMBER:
n/a

PURPOSE:

Separation mechanism between Black Brant Stage and forward stage (or payload).

PREVIOUS USAGE:

Used on multiple NASA GSFC/WFF Sounding rocket missions.

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

The system employs two (spaced 180° apart on the igniter housing) Gun/Blade Assemblies each containing a Halex G104 pressure cartridge. Each assembly severs a pair of shear screws which function to keep both halves of the v-band together. When the pressure cartridge is initiated, the piston-driven shear screw blade is propelled within the pressure cylinder assembly until it has made contact with the pair of screws and severed them. The V-Band is thus free to fall away and four compressed springs actuate separation between the two stages

OPERATING TEMPERATURE/PRESSURE:

NASA/DOD/DOE Pyrotechnic System

TITLE: Separation System - Centaur Standard Shroud (Fairing)

AGENCY/CENTER: NASA Lewis Research Center (LeRC)

PHYSICAL DATA:

CENTAUR STANDARD SHROUD (FAIRING) SEPARATION SYSTEM

CONTRACTOR: Lockheed Space and Missile Co.

SUBCONTRACTOR: n/a

SYSTEM IDENTIFICATION NUMBER:

n/a

PURPOSE:

To fail the frangible doubler joints on the second stage Centaur and payload shroud type fairing and thereby separate the longitudinal and lateral connections to allow jettison of the fairing from the vehicle.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

Titan Centaur vehicles TC-1 through TC-7

OPERATIONAL DESCRIPTION:

Pyrotechnically generated gases develop pressure that expand the flattened retaining tube into a circularized shape in section. The expanding tube applies force to the frangible structural separation joints causing failure along the grooved sections. This rupture of the joints separates the fairing halves from each other and from the launch vehicle. Spring forces then rotate the fairing halves apart and jettison them from the vehicle.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -65°F
High +275°F

PRESSURE: n/a

LIST OF DEVICES:

Electric detonator, SBASI
Non electric detonator (NED)
Shielded mild detonating cord (SMDC) transfer cord
Detonating cord and CRES tubing.

QUALIFICATION DOCUMENTATION:

n/a

ADDITIONAL REFERENCES:

n/a

ADDITIONAL COMMENTS:

Uses two detonating cords in the retaining tube. One is primary and is fired first. The second cord is a redundant part and is fired only if the first cord does not separate the fairing within a programmed time delay.

NASA/DOD/DOE Pyrotechnic System

TITLE: Separation System - Mars Observer Expansion Tube

AGENCY/CENTER: NASA Lewis Research Center (LeRC)

PHYSICAL DATA:

CONTRACTOR: Martin Marietta

SUBCONTRACTOR: Explosive Technology, Inc.

SYSTEM IDENTIFICATION NUMBER:
n/a

PURPOSE:

To separate the payload spacecraft from the launch vehicle by pyrotechnical fracture of the attaching frangible structural joint.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

Pyrotechnically formed gas pressure expands the flattened metallic tube into a circularized sectional shape. The force exerted by the rounding of the tube fractures the notched frangible doublers in shear. This joint failure separates the payload spacecraft from the launch vehicle. Initiation of the shielded mild detonating cords is by electrical bridgewire detonators, one detonator at each end of each cord length. After first detonator firing, a detonator per cord is fired after a time delay (for redundancy) following first detonator firing.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20°F
High 120°F

PRESSURE: n/a

LIST OF DEVICES:

Electrical detonator
Non electric transfer detonator
Shielded mild detonating (transfer) cord
Detonating cord and metal tubing

NASA/DOD/DOE Pyrotechnic System

TITLE: Separation System - Solid Rocket Booster Frustum

AGENCY/CENTER: NASA Marshall Space Flight Center (MSFC)

PHYSICAL DATA:

SOLID ROCKET BOOSTER FRUSTUM SEPARATION SHAPED CHARGE SYSTEM

CONTRACTOR: USBI

SUBCONTRACTOR: USBI

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To sever the tension ring that holds the frustum to the forward skirt and allow the drogue chute to pull the frustum away from the SRB.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

During recovery at an altitude of approximately 6,000 feet, the redundant low altitude barometric switches send fire commands to the frustum separation Pyrotechnic Initiator Controller (PIC) (main chute deployment) which initiates a NSD. The NSD is located in the top ring of the forward skirt. The output of the NSD is propagated through the pyrotechnic train of the Confined Detonating Fuse (CDF) assembly, detonator block assembly Linear Shaped Charge (LSC), and frustum separation assembly LSC. The LSC severs the tension ring that holds the frustum to the forward skirt and allows the drogue chute to pull the frustum away from the SRB for main chute deployment.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F for 12 hours
High +250° F

PRESSURE: Refer to specific components (devices).

LIST OF DEVICES:

1 NSD, SEB26100094-201
1 NSD / CDF Assembly Connector, 10183-0008-001
1 CDF Assembly, 10314-0001-104

TITLE: Separation/Release Systems - Apollo LEM and CSM

AGENCY/CENTER: NASA Johnson Space Center (JSC), Submitted by NASA
Langley Research Center (LaRC)

PHYSICAL DATA:

PROJECT APOLLO PYROTECHNIC ITEMS

CONTRACTOR: Lunar Excursion Module - Grumman Aircraft Command and
Service Module - Rockwell

SUBCONTRACTOR: n/a

SYSTEM IDENTIFICATION NUMBER:
n/a

PURPOSE:
Provide for manned landing on the moon.

PREVIOUS USAGE:
n/a

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

A solid-propellant rocket tower on top of the command service module provided for escape on the pad, following release of a flexible linear shaped charge (FLSC) separation joint. Normal flights utilized this separation joint to free the capsule from the Saturn V launch vehicle. The escape tower had to be released early in the normal flight sequence. Following translunar injection, the command service module (CSM) is separated and docks with the lunar excursion module (LEM). Following lunar orbit insertion, the LEM landing gear is deployed. The LEM's liquid propulsion and reaction control systems are activated and the LEM is unlocked for descent to the lunar surface. The ascent stage of the LEM is released and is propelled to a lunar orbital rendezvous with the CSM. Once the crew transfers to the CSM, the LEM is jettisoned. The CSM is propelled to return to Earth, followed by reentry and a parachute landing in water.

NASA/DOD/DOE Pyrotechnic System

TITLE: Shaped Charge System - Centaur Insulation Panel Separation

AGENCY/CENTER: NASA Lewis Research Center (LeRC)

PHYSICAL DATA:

CENTAUR INSULATION PANEL SEPARATION SYSTEM

CONTRACTOR: General Dynamics Space Systems Division (GDSSD)

SUBCONTRACTOR: No system vendor; only device vendors (see each device).

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To separate the four-segmented insulation panels longitudinally from each other and from the aft circular seal plate and the forward circular seal by severing the connections with flexible linear shaped charge for panel jettison from the vehicle.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

Expendable Launch Vehicles:
Atlas Centaur Vehciels through AC-68

OPERATIONAL DESCRIPTION:

The system has 3 main subsystems (1) longitudinal joint, (2) aft seal plate, and (3) fwd seal separation subsystems. There are four joint cutting subassemblies in the longitudinal joint subsystem and two semicircular joint cutters each in the aft and the fwd seal subsystems. Detonation transfer units and flexible linear shaped charge units, that include a nonelectric detonator (booster) at each end, are used in the subsystems.

At event time power activates the electro-explosive detonators in the dual detonator units. The resulting energy propagates firing in the detonation transfer units that transfer firing to the flexible linear shaped charges which do the joint severing by the heat and blast effect.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -300° F
High +200° F (except EED's)

PRESSURE: n/a

LIST OF DEVICES:

Electro-Explosive Detonator (EED); GDSSD 55-07041 (DDA Assy 55-74365)

Nonelectric Detonator (NED); GDSSD 55-07040

Mild Detonating Fuse (MDF) GDSSD 55-00212; (Transfer Assy 55-74355)

Flexible Linear Shaped Charge (FLSC); GDSSD 55-00211

QUALIFICATION DOCUMENTATION:

n/a

ADDITIONAL REFERENCES:

n/a

ADDITIONAL COMMENTS:

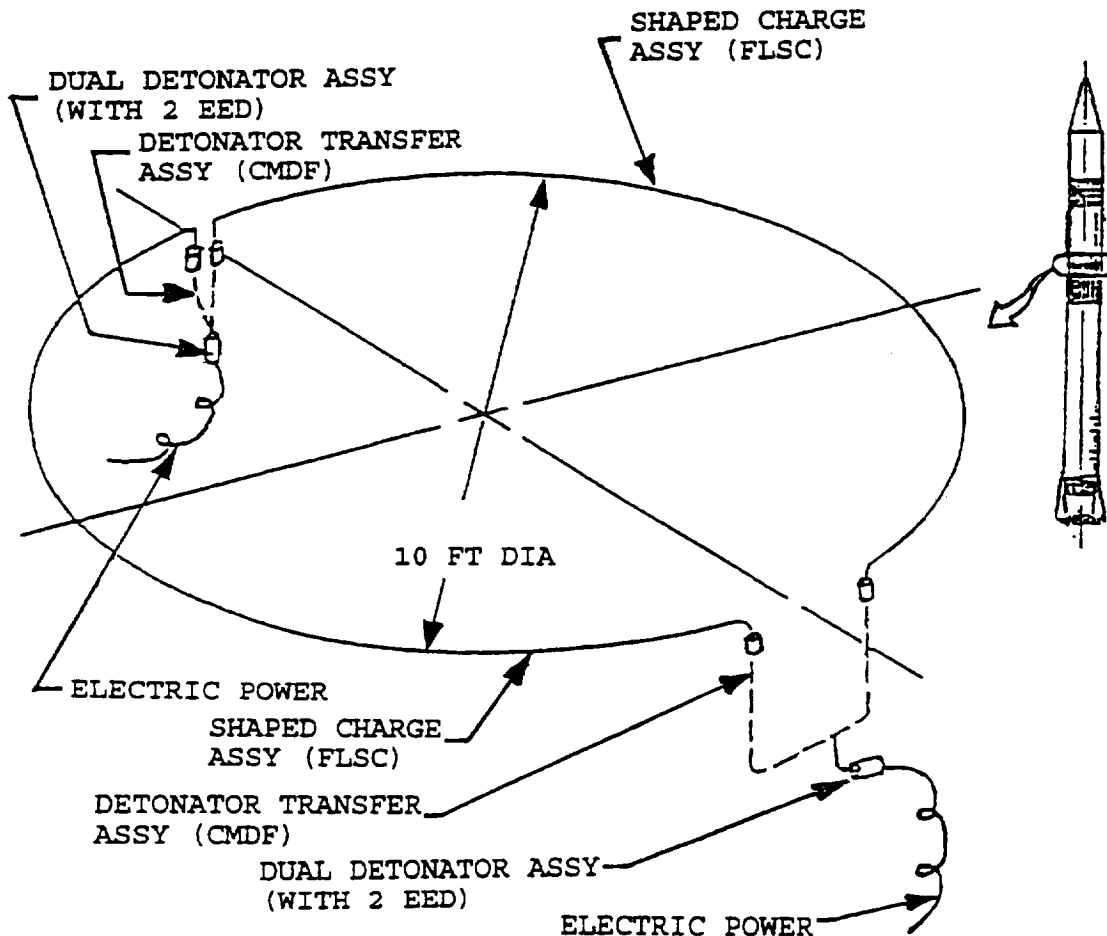

Interconnection and EED redundancy are such that detonation of one of the two EED's in only one of the two aft DDU's can activate both the longitudinal joint and the aft seal plate separation subsystems. Similarly, one EED can activate the fwd seal separation subsystem.

NASA/DOD/DOE Pyrotechnic System

TITLE: Shaped Charge System - Centaur Separation

AGENCY/CENTER: NASA Lewis Research Center (LeRC)

PHYSICAL DATA:

CENTAUR SEPARATION SYSTEM

CONTRACTOR: General Dynamics Space Systems Division (GDSSD)

SUBCONTRACTOR: No system vendor; only device vendors (see each device).

SYSTEM IDENTIFICATION NUMBER:
No system number; refer to specific components (devices).

PURPOSE:

To pyrotechnically sever the structural connection between the Centaur stage and the expended Atlas stage of Atlas/Centaur vehicle by cutting the forward ring of the interstage adapter with flexible linear shaped charge for separation, followed by jettison of the Atlas.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

Atlas/Centaur launch vehicles through AC-68.

OPERATIONAL DESCRIPTION:

The system uses two semicircular lengths of flexible linear shaped charge (FLSC) and four lengths of confined mild detonating fuse (CMDF) plus two dual detonator assemblies (DDA's) that contain two electro-explosive detonators (EED's) each. Non electric detonator (NED's), 12 total, are attached one to each end of the lengths of FLSC and CMDF. These NED's act as booster detonators to ensure propagation of the pyrotechnic activation from the EED's to the CMDF to the FLSC.

A programmed command, operating through control units, switches electrical power to thermally detonate the four heat sensitive EED type initiators. The activation is transferred to the lengths of CMDF which convey the activation to the FLSC's. Sufficient blast energy of the firing along the FLSC's cuts through the forward aluminum ring of the Centaur stage and severs the structural attachment to the Atlas stage.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -300 °F (except EED's = -65 °F)
High +200 °F

PRESSURE: n/a

LIST OF DEVICES:

Electro-Explosive Detonator (EED); GDSSD 55-07041 (DDA Assy 55-74365)

Nonelectric Detonator (NED); GDSSD 55-07040

Confined Mild Detonating Fuse (CMDF); GDSSD 55-00212 (Transfer Assy 55-74355)

Flexible Linear Shaped Charge (FLSC); GDSSD 55-00211 (Centaur Separation Assy 55-75882)

QUALIFICATION DOCUMENTATION:

n/a

ADDITIONAL REFERENCES:

n/a

ADDITIONAL COMMENTS:

Initiation redundancy is achieved in that detonation of only one of the four EED's is sufficient to activate both semicircular sections of FLSC's.

NASA/DOD/DOE Pyrotechnic System

TITLE: Shaped Charge System - Solid Rocket Motor (SRM) Nozzle Severance

AGENCY/CENTER: NASA Marshall Space Flight Center (MSFC)

PHYSICAL DATA:

SOLID ROCKET MOTOR (SRM) NOZZLE SEVERANCE SHAPED CHARGE SYSTEM

CONTRACTOR: Thiokol Corporation

SUBCONTRACTOR: Thiokol Corporation

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To pyrotechnically sever the SRM nozzle during reentry, allowing it to fall away from the Solid Rocket Booster (SRB) while preventing damage to the heat shield, aft skirt, and components mounted on the aft skirt at water impact.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

The SRM nozzle severance system consists of one NASA standard detonator (NSD) and four linear-shaped charge ring segments. When the SRM chamber pressure drops below 50 psia, two timers are triggered. After 30 seconds, the nozzle severance pyrotechnic initiator controller (PIC) is armed. After 70 seconds, a fire command is sent to both triggers of the nozzle severance PIC. The PIC initiates the NSD, Linear Shaped Charge (LSC) assembly pyrotechnic train, which severs the SRM nozzle. The SRM nozzle is now free to fall away from the SRB. A blast shield covering the LSC assembly prevents damage to the heat shield, aft skirt, and components mounted on the aft skirt during the pyrotechnic firing.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low 0° F
High +200° F

PRESSURE: Refer to specific components (devices).

OVERALL DIMENSIONS = 11.06 IN X 3.25 IN

THRUSTER ASSEMBLY MAIN LANDING GEAR UPLOCK RELEASE

CONTRACTOR: Rockwell International

SUBCONTRACTOR: SCOT Incorporated

SYSTEM IDENTIFICATION NUMBER:

NASA SKD26100102-202, Vendor 1001100-01, Main Landing Gear Uplock Release (MLGUR)

PURPOSE:

The function of the MLGUR Thruster is to unlatch the main landing gear doors of the Space Shuttle, drive the main landing gear uplock to the release position and move the landing gear itself.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

The device supplies up to 6150 pounds force through actuation of a cartridge which provides gas pressure against the piston. The piston supplies the force required to accomplish the tasks above. Two independent NSI cartridge assemblies are provided per MLGUR, either of which can operate the mechanism.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -80°F
High +350°F

PRESSURE: 3875 ± 350 PSI

LIST OF DEVICES:

One 1001200-201-01 Cartridge.

QUALIFICATION DOCUMENTATION:

SCOT Document 1001-200 Qualification Test Procedure.

NASA/DOD/DOE Pyrotechnic System

TITLE: Thruster System - Shuttle-Tail Service Mast Bonnet

AGENCY/CENTER: NASA Kennedy Space Center (KSC)

PHYSICAL DATA:

THRUSTER ASSEMBLY

CONTRACTOR: Lockheed Space Division-Shuttle Processing Contractor/
KSC

SUBCONTRACTOR: Pacific Scientific.

SYSTEM IDENTIFICATION NUMBER:

79K22641 NASA/KSC

PURPOSE:

The Bonnet Thruster is fired at T-0 and closes a steel door (Bonnet) after the Shuttle T-0 ground umbilical is pulled back into its protective housing (Tail Service Mast). The Bonnet closure protects the T-0 umbilical from blast damage.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

n/a

OPERATIONAL DESCRIPTION:

The system uses two Bonnet Thrusters, one for the hydrogen tail service mast and one for the LOX tail service mast. The thruster is initiated by two firing pins which are pulled by a lanyard attached to a 23,000 pound drop weight. The thruster provides a thrust of 2,250 pounds throughout a 16 inch stroke.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low n/a
High n/a

PRESSURE: n/a

LIST OF DEVICES:

The thruster is the only pyro device used in the system.

QUALIFICATION DOCUMENTATION:

79K22034 - fabrication and refurbishment of TSM Bonnet Thruster.

ADDITIONAL REFERENCES:

n/a

ADDITIONAL COMMENTS:

Redundancy is achieved by providing two firing pins for each thruster assembly.

NASA/DOD/DOE Pyrotechnic System

TITLE: Thruster System - SRB Nose Cap Separation

AGENCY/CENTER: NASA Marshall Space Flight Center (MSFC)

PHYSICAL DATA:

SOLID ROCKET BOOSTER (SRB) NOSE CAP SEPARATION THRUSTER SYSTEM

CONTRACTOR: USBI

SUBCONTRACTOR: USBI

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To holddown and, on command, release and accelerate the nose cap for SRB recovery.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

As the SRB freefalls to an altitude of approximately 16,000 feet, barometric switches send fire commands to the separation Pyrotechnic Initiator Controller (PIC) which initiates a NSD. The output of the detonator is propagated through a Confined Detonating Fuse (CDF) manifold and three CDF assemblies to three pressure cartridges located in the three thrusters spaced 120 degrees apart on the top ring of the frustum. The pressure cartridges produce pressure against the thruster piston shearing the thruster shear flange and producing a 30,000 pound thrust over a six-inch stroke. At the end of the stroke, the piston and rod separate, allowing the piston to remain in the thruster body and seal in all the products of combustion. The rod stays with the nose cap to prevent drogue line interference.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low +20° F

High +195° F for 4 hours

PRESSURE: Refer to specific components (devices).

LIST OF DEVICES:

- 1 NASA Standard Detonator (NSD), SEB26100094-202
- 3 Confined Detonating Fuse (CDF) Manifolds, 10312-0001-101
- 3 CDF Assemblies, 10314-0001-101 thru 10314-0001-103

TITLE: Valve System - Atlas Booster Separation

AGENCY/CENTER: NASA Lewis Research Center (LeRC)

PHYSICAL DATA:

ATLAS BOOSTER SEPARATION SYSTEM

CONTRACTOR: General Dynamics Space Systems Division (GDSSD)

SUBCONTRACTOR: Conax Corporation - for pyro valves

SYSTEM IDENTIFICATION NUMBER:

Refer to specific components in List of Devices (below)

PURPOSE:

To open a pneumatic line by pyrotechnically actuating two in-parallel, normally closed valves to the open position and allow pneumatic pressure to operate unlatching mechanisms.

NASA/DOD/DOE Pyrotechnic System

PREVIOUS USAGE:

Expendable Launch Vehicles: Atlas Centaur Vehicles through AC-68

OPERATIONAL DESCRIPTION:

Electric power issued at event time activates a pyro cartridge in each of the two normally closed valves that are connected in parallel for redundancy. Resulting pyro gas pressures force the piston rod cutter disks to shear out the diaphragms in the valves. The opened valves allow helium gas to flow to 10 pneumatically operated latches at the interface and separate the booster section from the Atlas sustainer section of the vehicle.

Titan Centaur Vehicles through TC-7

OPERATIONAL DESCRIPTION:

Immediately prior to liftoff the ground supply umbilical lines disconnect from the vehicle. Each of the two propellant tank ground supply pressure lines for Centaur stage utilize an onboard normally open valve that is pyrotechnically actuated to close at umbilical separation. The pyro valves reinforce line closure by backup to the disconnect poppet valves in the airborne portion of the disconnect.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -65 °F
High +200 °F

PRESSURE: n/a

LIST OF DEVICES:

Tank Pressurization Umbilical Shutoff Valve; GDSSD 55-08401
Detonator Cartridge; JPL 10049711

NASA/DOD/DOE Pyrotechnic System

TITLE: Valve System - External Tank (ET) Tumble

AGENCY/CENTER: NASA Marshall Space Flight Center (MSFC)

PHYSICAL DATA:

EXTERNAL TANK (ET) TUMBLE VALVE

CONTRACTOR: Martin-Marietta Corporation

SUBCONTRACTOR: Martin-Marietta Corporation

SYSTEM IDENTIFICATION NUMBER:

No system number; refer to specific components (devices).

PURPOSE:

To vent the gases from the LO2 tank and, after separation, to direct the gases so that it causes the ET to tumble.

PREVIOUS USAGE:

n/a

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

The ET tumble valve is located in the ET nose cap. The tumble valve actuates and starts venting the gases from the LO2 tank just prior to ET / Orbitor separation. After separation, the vented gases are directed so that it causes the ET to tumble. The tumbling action helps keep the ET from becoming aerodynamically stable during reentry and, therefore, aids in the ET breakup during reentry. The tumble valve is actuated by a pyrotechnic valve actuation cartridge in conjunction with a NASA Standard Detonator (NSD).

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -150° F

High +200° F for 4 hours

PRESSURE: Refer to specific components (devices).

LIST OF DEVICES:

1 Pyrotechnic Valve Actuation Cartridge, PD 5000011-009

1 Pyrotechnic-Operated tumble valve, PD 4700193-020

TITLE: Valve System - NOAA RCE Isolation

AGENCY/CENTER: NASA Goddard Space Flight Center (GSFC)

PHYSICAL DATA:

NOAA PAYLOAD RCE ISOLATION VALVE

CONTRACTOR: n/a

SUBCONTRACTOR: Pyronetics

SYSTEM IDENTIFICATION NUMBER:
Refer to List of Devices (below)

PURPOSE:
NOAA RCE Isolation Valve

PREVIOUS USAGE:
n/a

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

The RCE N2H4 isolation valves are normally open during ascent following completion of the spacecraft propulsive functions, the two RCE isolation valves are closed to prevent the flow of hydrazine to the thrusters for the remaining mission. Each valve is closed by firing the initiator which drives a guillotine-like blade which permanently closes the valve. Each closed valve will isolate its respective propellant tank from the Fill/drain and pressure sensor.

PURPOSE:
Spartan enable/disable pyrotechnic valve open/closes valve sealing propellant gases from pneumatic circuits

PREVIOUS USAGE:
n/a

NASA/DOD/DOE Pyrotechnic System

OPERATIONAL DESCRIPTION:

The pyrotechnic enable/disable valve (pyro valve) is a dual phase, dual stage unit where each cycle is driven by two EEDs that are simultaneously fired by separate ordnance circuits. The ordnance used is the NSI-1 standard initiator. Only one open/close cycle of the valve will be used on SP201, therefore, the valve will be equipped with four EEDs. When the EEDs are fired (both prime and backup) the products of combustion are completely contained within the body of the valve and all moving parts are contained.

OPERATING TEMPERATURE/PRESSURE:

TEMPERATURE RANGE: Low -260°F
High +300°F

PRESSURE: MOP 3000 PSIG

| 13. ABSTRACT (Maximum 200 words) A compilation of basic information on pyrotechnically actuated devices/systems used in NASA aerospace and aeronautic applications was formed into a catalog. The intent is to provide (1) a quick reference digest of the types of operational pyro mechanisms and (2) a source of contacts for further details. Data on these items was furnished by the NASA Centers that developed or utilized such devices to perform specific functions on spacecraft, launch vehicles, aircraft and ground support equipment. Information entries include an item title, user center name, commercial contractor and vendor, part number identification, a representative figure, and a brief description of purpose, previous usage, and operational characteristics. | | | | |
